Abstract

Intersection type systems have been *independently* applied to different evaluation strategies, such as call-by-name (CBN) and call-by-value (CBV). These type systems have been then generalized to different subsuming paradigms being able, in particular, to *encode* CBN and CBV in a *unique* unifying framework. However, there are no intersection type systems that explicitly enable CBN and CBV to cohabit together, without making use of an encoding into a common target framework.

This work proposes an intersection type system for a specific notion of evaluation for PCF, called PCFʜ. Evaluation in PCFʜ actually has a *hybrid* nature, in the sense that CBN and CBV operational behaviors cohabit together. Indeed, PCFʜ combines a CBV-like behavior for function application with a CBN-like behavior for recursion. This hybrid nature is reflected in the type system, which turns out to be *sound* and *complete* with respect to PCFʜ: not only typability implies normalization, but also the converse holds. Moreover, the type system is *quantitative*, in the sense that the size of typing derivations provides upper bounds for the length of the reduction sequences to normal form. This first type system is then refined to a *tight* one, offering *exact* information regarding the length of normalization sequences. This is the first time that a sound and complete quantitative type system has been designed for a hybrid computational model.

1 Introduction

Evaluation strategies govern how computation proceeds in programming languages. Two prominent strategies are *call-by-name* (CBN) and *call-by-value* (CBV) [23]. In CBN, arguments are not evaluated before being consumed by functions, while in CBV, arguments must be fully evaluated to *values* before function application can proceed.

These two ways to perform evaluation have their own advantages and drawbacks. CBV evaluation can sometimes be less costly than CBN, since CBV evaluates arguments only once, while CBN may have to evaluate many copies of a single argument. Conversely, sometimes CBN evaluation can be less costly than CBV, as CBN does not evaluate an *unused* argument while CBV always evaluates arguments, even if their value is not needed. For instance, if the function g is constantly 0 and Ω is a looping program, then $g(\Omega)$ produces 0 as a result in CBN while CBV evaluation does not terminate.

The main motivation of this work is to enhance our understanding of the *quantitative semantics* of programming language constructs such as inductive data types and recursion. The quantitative semantics of minimalistic languages such as the λ-calculus are relatively well-understood in both the CBN and CBV settings (see [8, 12]), but inductive data types and

---

recursion cannot be expressed directly, and must instead rely on some sort of *encoding*. In this work, we study PCFʜ, an extension of the λ-calculus that incorporates natural numbers, conditional expressions, and recursion through a fixed-point operator without resorting to an encoding.

Non-idempotent intersection types. Intersection types (IT), pioneered by Coppo and Dezani [9], extend simple types with a new *intersection* type constructor ($\cap$), in such a way that a term is assigned the type $\tau \cap \sigma$ if and only if it is assigned both types τ and σ. Originally, intersection is commutative, associative and, in particular, *idempotent*, *i.e.* τ and $\tau \cap \tau$ are equivalent. An intersection $\tau_1 \cap \ldots \cap \tau_n$ can thus be specified by a *set* $\{\tau_1, \ldots, \tau_n\}$. IT were motivated by semantical concerns. A key property is that typability is preserved by *conversion* (reduction *and* expansion), in contrast with simple types, in which typability is preserved by reduction but not expansion. This technical property allows to study normalization from a type theoretical point of view. In intersection types, a term is typable if and only if it is normalizing, while in simple types, typable terms are normalizing but the converse does not hold.

A more recent line of research is that of *non-idempotent* IT [17, 8], in which $\tau \cap \tau$ is not equivalent to τ. Here, an intersection $\tau_1 \cap \ldots \cap \tau_n$ may be specified by a *multiset* $[\tau_1, \ldots, \tau_n]$. These systems draw inspiration from Linear Logic (LL) [18], as in fact, non-idempotent intersection corresponds to LL's multiplicative conjunction ($\otimes$) [8]. Just like in the idempotent case, non-idempotent IT characterize normalization by means of typability [8]. Moreover, non-idempotent types have some advantages over idempotent ones; one key benefit is their ability to capture *quantitative* information about the dynamic behavior of programs. For example, in non-idempotent IT one can not only prove that a term t is normalizing if and only if it is typable, but also obtain an *upper bound* for the length of the evaluation sequence of t to normal form. Since these systems are inspired by linear logic and resource consumption [17], they are called *quantitative* type systems. Several works have explored non-idempotent intersection type systems in the context of CBN [10, 7] and CBV [12, 3, 20]. In these systems, the quantitative information can usually be recorded using *counters* that decorate typing judgments. For example, a typical judgment may be of the form $\Gamma \vdash^n t : \tau$, meaning that t normalizes to a normal form of type τ, and that the number of reduction steps required to reduce t to normal form is *bounded* by the value of the counter $n \in \mathbb{N}$.

Quantitative properties provided by non-idempotent intersection type systems can be refined using a syntactic property, *tightness*, achieved by using only *minimal* type derivations [2]. Tightness allows to extract from typing derivations not only *upper bounds* but rather *exact* quantitative information. Indeed, in tight derivations, a concluding judgment is still of the form $\Gamma \vdash^n t : \tau$, but now the counter $n \in \mathbb{N}$ indicates that *exactly n* reduction steps are required to reduce t to normal form.

PCF and PCFʜ. *Programming Computable Functions* (PCF) [24] is a functional programming language designed to serve as a foundational computational model. It extends the simply-typed λ-calculus with natural numbers, conditional expressions, and general recursion (through a fixed-point operator). PCF is simultaneously minimalistic, expressive, and rigorous, making it an ideal vehicle to study programming language semantics. Historically, it has been used to study the correspondence between operational and denotational semantics, *i.e.*, the *full abstraction* problem [24, 22, 1, 16].

In this work, we study a variant of PCF called PCFʜ, in which function application and evaluation of conditional expressions follow a CBV discipline. Besides that, the rule to *unfold*

a fixed-point is the standard one, namely:

$$\mathsf{fix}\, x.\, t \to t\{x := \mathsf{fix}\, x.\, t\}$$

A noteworthy remark is that the semantics of recursion is akin to CBN rather than to CBV since the fixed-point can make copies of itself, which is *not* a value yet. Given this "mixed" operational behavior, we say that evaluation in PCFʜ is *hybrid*. The fact that evaluation is hybrid is challenging from the point of view of quantitative semantics [20, 5] because it requires synthesizing characteristics of CBN and CBV in a single system.

A note on nomenclature.   Languages closely related to PCFʜ are sometimes said to be "call-by-value" [11]. As explained above, evaluation in PCFʜ is actually hybrid because unfolding a fixed-point may produce copies of itself, substituting a variable by an expression that is not a value yet. We write PCFʜ to highlight the fact that evaluation is hybrid, as indicated by the subscript "H".

Related work.   There is a vast amount of literature on PCF. In particular, various notions of evaluation have been proposed for PCF; for instance, [19] provides insights on differences and similarities between CBV semantics and CBN semantics. A probabilistic version of PCF is presented in [16], which follows a CBN discipline but is still hybrid in that it exhibits a CBV behavior for its conditional operator.

Furthermore, some works explore semantical aspects of PCF that are connected to our own. In [13], Ehrhard studies an interpretation of a Call-by-Push-Value (CBPV) λ-calculus with disjoint unions and fixed-points (encompassing PCF) in LL, and it derives an intersection type system from the Scott model of LL. The unfolding of a fixed-point operator can duplicate itself by copying a value that represents its suspended computation. Technically, this is achieved by relying on the of-course (!) modality of LL. The resulting type system is in the style of Coppo–Dezani, with *idempotent* intersections, and thus not quantitative.

Recent work in [14] derives an intersection type system for a differential extension of PCF from a relational semantics. It is shown that typability in this system implies normalization by means of a reducibility argument, but the quantitative aspect is not studied. In contrast, we prove soundness and completeness by elementary means, and we characterize quantitative upper bounds and exact bounds via our non-idempotent type system.

There are other languages in the literature that allow the encoding of CBN/CBV behavior, such as Levy's *call-by-push-value* (CBPV) [21] and Ehrhard and Guerrieri's *Bang Calculus* [15]. They attempt to unify CBN and CBV in a single framework, but they are not hybrid because they only allow duplicating values. Recent works [20, 5] propose quantitative type systems for *adequate* variants of the Bang Calculus. These works study upper bounds and exact bounds. However, they are not able to express recursion and integers directly, but only through encodings.

Contributions.   As a main contribution, we propose a quantitative model for the hybrid calculus PCFʜ, based on a non-idempotent intersection type system. The type system is proved to be sound and complete with respect to the operational semantics: it characterizes normalizing terms and provides upper bounds for the length of reductions to normal form. A peculiar feature of this system is that it distinguishes between those variables bound by λ-abstractions from those bound by fixed-point operators. The former may be substituted by *values* while the latter may be substituted by arbitrary *expressions*. Type assignment rules work differently for

these two kinds of variables because a value is assigned one type each time it will be used (as in CBV), while an arbitrary expression may be copied to produce many values (as in CBN).

As a second contribution, we refine the type system to obtain a *tight* version, which provides *exact* bounds for reduction lengths to normal form, instead of upper bounds.

To the best of our knowledge, this is the first quantitative type interpretation that is adequate for a hybrid system.

Structure of the paper.   Section 2 covers the syntax and operational semantics of PCFн. Section 3 introduces a quantitative type system for PCFн. Finally, the paper concludes by summarizing our work and outlining potential directions for future work.

2   The PCFн calculus

This section introduces the syntax of PCFн, together with its associated operational semantics, which follows a hybrid evaluation. We characterize the set of normal forms induced by the operational semantics through a grammar (Proposition 2). Moreover, as the evaluation strategy is not necessarily deterministic, we show that it enjoys the Diamond Property (Proposition 3), which implies in particular that all evaluation sequences to normal form have the same length, thus justifying the use of the proposed strategy to study quantitative behaviors.

Given a denumerable set of **variables** $(x, y, z, \ldots)$, we define **terms** $(t, s, u, \ldots)$, **values** $(\mathbf{v}, \mathbf{w}, \ldots)$, and **natural values** $(\mathbf{k}, \mathbf{l}, \ldots)$ using the following grammar:

$$t ::= x \mid \lambda x.\, t \mid t\, t \mid \mathbf{0} \mid \mathbf{S}(t) \mid \mathsf{if}(t, t, x.\, t) \mid \mathsf{fix}\, x.\, t$$

$$\mathbf{v} ::= \lambda x.\, t \mid \mathbf{k} \qquad \mathbf{k} ::= \mathbf{0} \mid \mathbf{S}(\mathbf{k})$$

Terms include **variables** x, **abstractions** $\lambda x.\, t$, **applications** $t\, s$, a **fixed-point operator** $\mathsf{fix}\, x.\, t$, as well as syntax for natural numbers: **zero** $\mathbf{0}$, **the successor constructor** $\mathbf{S}(t)$, and a **conditional operator** $\mathsf{if}(t, s, x.\, u)$. Free and bound occurrences of variables are defined as expected, considering that the free occurrences of x in u are bound in $\mathsf{if}(t, s, x.\, u)$ and in $\mathsf{fix}\, x.\, u$. Terms are considered up to α-renaming of bound variables. We write $t\{x := s\}$ for the capture-avoiding substitution of the free occurrences of x by s in t.

The operational semantics of PCFн is given by a reduction relation $\to_\rho$ indexed by a **rule name** $\rho \in \{\mathtt{B}, \mathtt{I0}, \mathtt{IS}, \mathtt{F}\}$, and it is defined by the following set of rules:

$$\frac{}{(\lambda x.\, t)\, \mathbf{v} \to_\mathtt{B} t\{x := \mathbf{v}\}}\ \texttt{r-beta} \qquad \frac{}{\mathsf{if}(\mathbf{0}, t, x.\, s) \to_\mathtt{I0} t}\ \texttt{r-if0}$$

$$\frac{}{\mathsf{if}(\mathbf{S}(\mathbf{k}), t, x.\, s) \to_\mathtt{IS} s\{x := \mathbf{k}\}}\ \texttt{r-ifS} \qquad \frac{}{\mathsf{fix}\, x.\, t \to_\mathtt{F} t\{x := \mathsf{fix}\, x.\, t\}}\ \texttt{r-fix}$$

$$\frac{t \to_\rho t'}{t\, s \to_\rho t'\, s}\ \texttt{r-appL} \qquad \frac{s \to_\rho s'}{t\, s \to_\rho t\, s'}\ \texttt{r-appR}$$

$$\frac{t \to_\rho t'}{\mathbf{S}(t) \to_\rho \mathbf{S}(t')}\ \texttt{r-succ} \qquad \frac{t \to_\rho t'}{\mathsf{if}(t, s, x.\, u) \to_\rho \mathsf{if}(t', s, x.\, u)}\ \texttt{r-if}$$

The resulting evaluation strategy is *closed* (no reduction of terms with free variables) and *weak* (no evaluation under abstractions).

Several variants of PCF can be found in the literature. In this presentation, function application follows a CBV discipline because the argument of an application must be evaluated until

it becomes a value, so that the rule `r-beta` can be applied. The conditional operator follows a CBV discipline as well, as the guard must be fully evaluated to a value so that one of the rules `r-if0` or `r-ifS` can be applied. The conditional $\mathsf{if}(t, s, x.\, u)$ returns s if t is zero, and u if t is non-zero, binding x to its predecessor. A consequence of this is that the predecessor function can be defined using the conditional operator; *e.g.* $\mathsf{if}(\mathbf{S}(\mathbf{k}), \mathbf{0}, x.\, x) \rightarrow_{\mathrm{IS}} \mathbf{k}$, a variant which can be found in [16].

To illustrate this strategy, let us evaluate the term $\mathsf{if}(\mathbf{S}(\mathbf{0}), \mathsf{id}, x.\, \lambda y.\, x)\, \mathbf{S}(\mathbf{S}(\mathbf{0}))$ in one step, where $\mathsf{id} := \lambda z.\, z$:

$$
\cfrac{\cfrac{}{\mathsf{if}(\mathbf{S}(\mathbf{0}), \mathsf{id}, x.\, \lambda y.\, x) \rightarrow_{\mathrm{IS}} (\lambda y.\, x)\{x := \mathbf{0}\}}\ \texttt{r-ifS}}{\mathsf{if}(\mathbf{S}(\mathbf{0}), \mathsf{id}, x.\, \lambda y.\, x)\, \mathbf{S}(\mathbf{S}(\mathbf{0})) \rightarrow_{\mathrm{IS}} (\lambda y.\, \mathbf{0})\, \mathbf{S}(\mathbf{S}(\mathbf{0}))}\ \texttt{r-appL}
$$

After one more reduction step, by rule `r-beta`, we obtain $(\lambda y.\, \mathbf{0})\, \mathbf{S}(\mathbf{S}(\mathbf{0})) \rightarrow_{\mathrm{B}} \mathbf{0}$.

Let us write $t \rightarrow s$ if $t \rightarrow_\rho s$ for some rule name ρ. A term t is $\rightarrow$-**reducible** if there exists s such that $t \rightarrow s$; and t is $\rightarrow$-**irreducible** if t is not $\rightarrow$-reducible. For the example above, $\mathbf{0}$ is $\rightarrow$-irreducible, while $\mathsf{if}(\mathbf{S}(\mathbf{0}), \mathsf{id}, x.\, \lambda y.\, x)\, \mathbf{S}(\mathbf{S}(\mathbf{0}))$ is $\rightarrow$-reducible.

Terms that cannot be further $\rightarrow$-reduced are also called **normal forms**. In the following, we characterize the normal forms of the proposed strategy by means of an inductive definition. Normal forms are of different kinds or *natures*. For instance, $\lambda x.\, x\, x$ is a normal form of *abstraction* nature, while $\mathbf{S}(\mathbf{0})$ is a normal form of *natural number* nature. The preceding normal forms are intuitively "meaningful", and they are said to be *proper*; these normal forms are those that can be successfully typed in a quantitative type system, as we discuss in the next section. In contrast, there are intuitively "meaningless" normal forms such as $\mathbf{S}(\lambda x.\, t)$, or $\mathbf{0}\, t$, or $\mathsf{if}(\lambda x.\, t, s, y.\, u)$. These are said to be *stuck*. Stuck normal forms do not have any meaning, so they cannot be typed in a quantitative type system. We return to this point in the next section.

Formally, we first distinguish between different *natures* which will be used to index the sets of normal forms. Thus, we establish the sets of **proper natures**, $\nu \in \{\mathsf{abs}, \mathsf{nat}\}$ and **fallible natures**, $\varepsilon \in \{\mathsf{abs}, \mathsf{nat}, \mathsf{stuck}\}$.

We write NF_ε to denote the set of **normal forms** indexed by a fallible nature ε, which is defined by the following rules:

$$
\cfrac{}{\lambda x.\, t \in \mathsf{NF}_{\mathsf{abs}}}\ \texttt{nf-abs} \qquad
\cfrac{t \in \mathsf{NF}_\varepsilon \quad s \in \mathsf{NF}_{\varepsilon'} \quad \varepsilon \neq \mathsf{abs}}{t\, s \in \mathsf{NF}_{\mathsf{stuck}}}\ \texttt{nf-app} \qquad
\cfrac{}{\mathbf{0} \in \mathsf{NF}_{\mathsf{nat}}}\ \texttt{nf-zero}
$$

$$
\cfrac{t \in \mathsf{NF}_{\mathsf{nat}}}{\mathbf{S}(t) \in \mathsf{NF}_{\mathsf{nat}}}\ \texttt{nf-succ-nat} \qquad
\cfrac{t \in \mathsf{NF}_\varepsilon \quad \varepsilon \neq \mathsf{nat}}{\mathbf{S}(t) \in \mathsf{NF}_{\mathsf{stuck}}}\ \texttt{nf-succ-stuck} \qquad
\cfrac{t \in \mathsf{NF}_\varepsilon \quad \varepsilon \neq \mathsf{nat}}{\mathsf{if}(t, s, x.\, u) \in \mathsf{NF}_{\mathsf{stuck}}}\ \texttt{nf-if}
$$

For instance, $\lambda y.\, \mathsf{id}\,\mathsf{id} \in \mathsf{NF}_{\mathsf{abs}}$ because of rule `nf-abs`, while $(\lambda y.\, y\, \mathbf{0})\, \mathsf{id}$ is not in normal form since its left subterm is in normal form but with the proper nature abs.

The results below show that this inductively defined notion of normal form characterizes exactly the set of irreducible terms. This syntactic characterization is a key ingredient to show that the quantitative type system studied in Section 3 is sound and complete. We start with a simple observation regarding the expected form of normal forms based on their assigned proper natures:

Lemma 1. *Let $t \in \mathsf{NF}_\varepsilon$. Then:*

1. *$\varepsilon = \mathsf{abs}$ if and only if t is of the form $\lambda x.\, s$,*

   2. $\varepsilon = \mathsf{nat}$ *if and only if t is of the form* **k***.*

Proof. See Appendix A for details.   □

The characterization of normal forms then follows using the previous lemma:

Proposition 2 (Characterization of normal forms)**.** *For any closed term t the following are equivalent:*

   1. *There exists a fallible nature ε such that $t \in \mathsf{NF}_\varepsilon$.*

   2. *t is $\to$-irreducible.*

Proof. See Appendix A for details.   □

Evaluation of applications is non-deterministic, *e.g.* consider $((\lambda x.\, \mathbf{S}(x))\, \mathbf{0})\, (\mathsf{if}(\mathbf{0}, \mathtt{id}, y.\, y\, \mathtt{id}))$. This term reduces in one step to $\mathbf{S}(\mathbf{0})\, (\mathsf{if}(\mathbf{0}, \mathtt{id}, y.\, y\, \mathtt{id}))$ by rules `r-appL` and `r-beta`, and it also reduces in one step to $((\lambda x.\, \mathbf{S}(x))\, \mathbf{0})\, \mathtt{id}$ by rule `r-if0`. Thus, we need to ensure that evaluating terms leads to unique normal forms, despite some form of non-determinism during the computation. To achieve this, we prove the Diamond Property for the relation $\to$, saying that if a term reduces in one step to two different terms t_1 and t_2, then both terms converge in one step to the same common reduct. This is a strong form of confluence, which in particular ensures that all reductions to normal form have the same length:

Proposition 3 (Diamond property)**.** *If $t \to_{\rho_1} t_1$ and $t \to_{\rho_2} t_2$ where $t_1 \neq t_2$ then there exists t' such that $t_1 \to_{\rho_2} t'$ and $t_2 \to_{\rho_1} t'$.*

Proof. By induction on t. Details in Appendix A.   □

Let us take the term of the example above to illustrate this property:

$$
\begin{array}{ccc}
((\lambda x.\, \mathbf{S}(x))\, \mathbf{0})\, (\mathsf{if}(\mathbf{0}, \mathtt{id}, y.\, y\, \mathtt{id})) & \xrightarrow{\;\;\mathtt{B}\;\;} & \mathbf{S}(\mathbf{0})\, (\mathsf{if}(\mathbf{0}, \mathtt{id}, y.\, y\, \mathtt{id})) \\
\Big\downarrow {\scriptstyle \mathtt{I0}} & & \Big\downarrow {\scriptstyle \mathtt{I0}} \\
((\lambda x.\, \mathbf{S}(x))\, \mathbf{0})\, \mathtt{id} & \dashrightarrow{\;\;\mathtt{B}\;\;} & \mathbf{S}(\mathbf{0})\, \mathtt{id}
\end{array}
$$

Moreover $\mathbf{S}(\mathbf{0})\, \mathtt{id} \in \mathsf{NF}_{\mathsf{stuck}}$ by rule `nf-app`.

3   A Quantitative Type System for PCFʜ

In this section, we introduce system $\mathcal{H}$ (for *hybrid*), a non-idempotent intersection type system for PCFʜ. A type derivation for a term in system $\mathcal{H}$ provides upper bounds for its normalization sequences. Moreover, by considering only *tight* typing derivations, we obtain *exact* bounds. System $\mathcal{H}$ aligns with other formulations of non-idempotent intersection type systems and satisfies fundamental properties such as Subject Reduction (Lemma 11) and Subject Expansion (Lemma 14). Remarkably, this system captures the combined essence of the two underlying evaluation strategies found in PCFʜ, which are CBV and CBN.

The remainder of the section unfolds as follows: Section 3.1 defines the set of types and typing rules governing $\mathcal{H}$. Section 3.2 delves into the proof of soundness and completeness of $\mathcal{H}$ with respect to the evaluation strategy PCFʜ. For this, we show two quantitative results: Theorem 17 provides upper bounds for normalization sequences for any kind of type derivations, while Theorem 18 provides exact bounds for normalization sequences for those type derivations that are tight.

3.1　The Type System $\mathcal{H}$

Recall that values in PCFʜ are either abstractions or natural values of the form $\mathbf{S}(\mathbf{S}(\ldots\mathbf{S}(\mathbf{0})))$. A value in PCFʜ may be *used* zero, one, or many times. For example, the underlined identity function in $(\lambda f.\, f\,(f\,\mathbf{0}))\,\underline{\mathtt{id}}$ is used twice in a reduction to normal form since it is bound to the variable f that appears twice, and the underlined zero in $(\lambda x.\,\mathsf{if}(x,\mathbf{0},y.\,y))\,\underline{\mathbf{0}}$ is used exactly once in a reduction to normal form because it is bound to a single occurrence of x tested for zero equality.

A noteworthy characteristic of non-idempotent intersection type systems is their ability to capture the several roles a single expression may play in different contexts, so in these type systems *terms do not necessarily have a unique type*. Indeed, in system $\mathcal{H}$, values are given a *multitype* of the form $\mathcal{T} = [\tau_1, \ldots, \tau_n]^\nu$, which consists of a multiset of types $[\tau_1, \ldots, \tau_n]$ decorated with a nature ν, and corresponding to the (non-idempotent) intersection $\tau_1 \cap \ldots \cap \tau_n$. Each τ_i corresponds to one *use* of the value. System $\mathcal{H}$ captures the hybrid behavior of PCFʜ by splitting the typing information into two parts, called the *typing context* and the *family context*. The typing context contains typing information for variables bound by *abstractions* and *conditional operators*. These variables behave like in CBV, in the sense that they can only be substituted by *values*, and thus they are assigned a multitype. The family context contains typing information for variables bound by *fixed-point operators*. These variables behave like in CBN, as they can be substituted by *unevaluated expressions*. Since an unevaluated expression may be copied many times and each copy produces a value, these variables are assigned a multiset of multitypes $\mathcal{F} = \{\!\{\mathcal{T}_1, \ldots, \mathcal{T}_n\}\!\}$, called a *multitype family*.

We note $[\ldots]$ for the multisets of types and $\{\!\{\ldots\}\!\}$ for the multisets of multitypes. This is just for visual clarity and to emphasize the different roles they play in the type system. However, both notations denote multisets, and both behave like non-idempotent intersections.

Formally, types of $\mathcal{H}$ are given by the following grammar:

$$
\begin{array}{rrcl}
(\textbf{Types}) & \tau & ::= & \mathbb{A} \mid \mathbb{N} \\
(\textsf{abs-}\textbf{Types}) & \mathbb{A} & ::= & \mathcal{T}^? \to \mathcal{T} \\
(\textsf{nat-}\textbf{Types}) & \mathbb{N}, \mathbb{M}, \ldots & ::= & \mathbb{0} \mid \mathbb{S}(\mathcal{N}) \\
(\textbf{Optional Multitypes}) & \mathcal{T}^? & ::= & \bot \mid \mathcal{T} \\
(\textbf{Multitypes}) & \mathcal{T}, \mathcal{S}, \mathcal{U}, \mathcal{R}, \ldots & ::= & \mathcal{A} \mid \mathcal{N} \\
(\textsf{abs-}\textbf{Multitypes}) & \mathcal{A}, \mathcal{B} & ::= & [\mathbb{A}_i]^{\textsf{abs}}_{i \in I} \\
(\textsf{nat-}\textbf{Multitypes}) & \mathcal{N}, \mathcal{M}, \mathcal{P}, \ldots & ::= & [\mathbb{N}_i]^{\textsf{nat}}_{i \in I} \\
(\textbf{Multitype Families}) & \mathcal{F} & ::= & \{\!\{\mathcal{T}_i\}\!\}_{i \in I}
\end{array}
$$

A ν-multitype is a multiset of ν-types decorated with a nature ν. *E.g.*, $[\mathbb{0}, \mathbb{0}, \mathbb{S}([\,]^{\textsf{nat}})]$ is a multiset of nat-types, and $[\mathbb{0}, \mathbb{0}, \mathbb{S}([\,]^{\textsf{nat}})]^{\textsf{nat}}$ is a nat-multitype. The decoration is important to distinguish $[\,]^{\textsf{nat}}$ from $[\,]^{\textsf{abs}}$, so that a clear distinction is made between variables that are bound to natural numbers from those that are bound to abstractions.

Note that a multitype is either a nat-multitype or an abs-multitype. A ν-multitype is said to be of nature ν. Two multitypes are **compatible** if they are of the same nature. For example, $[\mathbb{0}]^{\textsf{nat}}$ is compatible with $[\mathbb{S}([\,]^{\textsf{nat}})]^{\textsf{nat}}$ but not with $[\mathcal{T}^? \to \mathcal{T}]^{\textsf{abs}}$. This notion is extended to optional multitypes by declaring that $\mathcal{T}^?$ and $\mathcal{S}^?$ are compatible if either of them is $\bot$ or if they are compatible multitypes. The **sum** of compatible multitypes is defined by $[\mathbb{A}_1, \ldots, \mathbb{A}_n]^{\textsf{abs}} + [\mathbb{A}_{n+1}, \ldots, \mathbb{A}_{n+m}]^{\textsf{abs}} = [\mathbb{A}_1, \ldots, \mathbb{A}_{n+m}]^{\textsf{abs}}$ and, similarly, $[\mathbb{N}_1, \ldots, \mathbb{N}_n]^{\textsf{nat}} + [\mathbb{N}_{n+1}, \ldots, \mathbb{N}_{n+m}]^{\textsf{nat}} = [\mathbb{N}_1, \ldots, \mathbb{N}_{n+m}]^{\textsf{nat}}$. This operation is extended to compatible optional multitypes in the following way: $\bot + \bot = \bot$ and $\bot + \mathcal{T} = \mathcal{T}$ and $\mathcal{T} + \bot = \mathcal{T}$. Note that $\bot$ is the neutral element of the sum.

A **family context**, written $\Phi, \Psi, \ldots$, is a function mapping variables to multitype families such that $\Phi(x) \neq \{\!\!\{\,\}\!\!\}$ for finitely many variables x. The **sum** of family contexts is defined by $(\Phi + \Psi)(x) = \Phi(x) \oplus \Psi(x)$, where $\oplus$ is the sum of multisets of multitypes, defined as the disjoint union of multisets. The **domain** of a family context Φ is defined as $\mathsf{dom}(\Phi) \stackrel{\mathrm{def}}{=} \{x \mid \Phi(x) \neq \{\!\!\{\,\}\!\!\}\}$, and $\varnothing$ denotes the empty family context, mapping every variable to $\{\!\!\{\,\}\!\!\}$.

A **typing context**, written $\Gamma, \Delta, \ldots$, is a function mapping variables to optional multitypes such that $\Gamma(x) \neq \bot$ for finitely many variables x. Two typing contexts Γ, Δ are compatible if $\Gamma(x)$ and $\Delta(x)$ are compatible for every variable x. The **sum** of compatible typing contexts is defined by $(\Gamma + \Delta)(x) = \Gamma(x) + \Delta(x)$. The **domain** of a typing context Γ is defined as $\mathsf{dom}(\Gamma) \stackrel{\mathrm{def}}{=} \{x \mid \Gamma(x) \neq \bot\}$, and $\varnothing$ denotes the empty typing context, mapping every variable to $[\,]$.

A binary relation of **subsumption** $\mathcal{T}_1^? \lhd \mathcal{T}_2$ is defined by two cases, stating that $\bot \lhd [\,]^\nu$ and $\mathcal{T} \lhd \mathcal{T}$ hold. Subsumption is used to introduce a controlled form of weakening in the system (see Example 3.1 below).

A **multi-counter** $\mathfrak{m}$ is a multiset of rule names, whose cardinality is denoted by $\#(\mathfrak{m})$. **Typing judgments** are of the form $\Phi; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$, where Φ is a family context, Γ is a typing context, t is a term and $\mathcal{T}$ is a multitype. Moreover, each judgment typing a term t is decorated with a multi-counter $\mathfrak{m}$, which traces all the rewriting rules that are used to evaluate the term t to normal form. This means in particular that $\#(\mathfrak{m})$ reflects the length of evaluation sequences to normal form. The decision to use counters that are multisets of rule names instead of natural numbers is to store more precise information. Moreover, we use a multiset rather than a 4-uple of distinct counters, as used for example in [20], to avoid unnecessarily inflating the notation.

As mentioned before, variables can receive two distinct assignments depending on whether they occur in the family context or the typing context. When a variable is assigned a multitype family in the family context, it will be involved in the evaluation of a fixed-point operator, meaning that it is intended to be substituted by an unevaluated expression, like in CBN. Instead, when a variable is assigned a multitype in the typing context, it is intended to be substituted by a value, like in CBV. There is an invariant in $\mathcal{H}$ stating that family contexts and typing contexts do not share variables, *i.e.* $\mathsf{dom}(\Phi) \cap \mathsf{dom}(\Gamma) = \varnothing$. When studying properties for $\mathcal{H}$ we assume implicitly that this invariant holds.

Typing rules for the typing system are the following:

$$\frac{}{\varnothing; x : \mathcal{T} \vdash^{[\,]} x : \mathcal{T}} \; \texttt{t-var}_1 \qquad \frac{}{x : \{\!\!\{\mathcal{T}\}\!\!\}; \varnothing \vdash^{[\,]} x : \mathcal{T}} \; \texttt{t-var}_2$$

$$\frac{(\Phi_i; \Gamma_i, x : \mathcal{T}_i^? \vdash^{\mathfrak{m}_i} t : \mathcal{S}_i)_{i \in I}}{+_{i \in I} \Phi_i; +_{i \in I} \Gamma_i \vdash^{+_{i \in I} \mathfrak{m}_i} \lambda x.\, t : [\mathcal{T}_i^? \to \mathcal{S}_i]_{i \in I}^{\mathsf{abs}}} \; \texttt{t-abs}$$

$$\frac{\Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1} t : [\mathcal{T}^? \to \mathcal{S}]^{\mathsf{abs}} \qquad \mathcal{T}^? \lhd \mathcal{T} \qquad \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} s : \mathcal{T}}{\Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{[\mathtt{B}] + \mathfrak{m}_1 + \mathfrak{m}_2} t\, s : \mathcal{S}} \; \texttt{t-app}$$

$$\frac{}{\varnothing; \varnothing \vdash^{[\,]} \mathbf{0} : [\mathbb{0}]_{i \in I}^{\mathsf{nat}}} \; \texttt{t-zero} \qquad \frac{\Phi; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{N} \qquad \mathcal{N} = +_{i \in I} \mathcal{N}_i}{\Phi; \Gamma \vdash^{\mathfrak{m}} \mathbf{S}(t) : [\mathbb{S}(\mathcal{N}_i)]_{i \in I}^{\mathsf{nat}}} \; \texttt{t-succ}$$

$$\frac{\Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1} t : [\mathbb{0}]^{\mathsf{nat}} \qquad \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} s : \mathcal{T}}{\Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{[\mathtt{I0}] + \mathfrak{m}_1 + \mathfrak{m}_2} \mathsf{if}(t, s, x.\, u) : \mathcal{T}} \; \texttt{t-ifZero}$$

$$\frac{\Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1} t : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}} \qquad \mathcal{N}^? \lhd \mathcal{N} \qquad \Phi_2; \Gamma_2, x : \mathcal{N}^? \vdash^{\mathfrak{m}_2} u : \mathcal{T}}{\Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{[\mathtt{IS}] + \mathfrak{m}_1 + \mathfrak{m}_2} \mathsf{if}(t, s, x.\, u) : \mathcal{T}} \; \texttt{t-ifSucc}$$

$$\frac{\Phi, x : \{\!\{\mathcal{T}_i\}\!\}_{i \in I}; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{S} \qquad (\Phi_i; \Gamma_i \vdash^{\mathfrak{m}_i} \mathsf{fix}\, x.\, t : \mathcal{T}_i)_{i \in I}}{\Phi +_{i \in I} \Phi_i; \Gamma +_{i \in I} \Gamma_i \vdash^{[\mathsf{F}] + \mathfrak{m} +_{i \in I} \mathfrak{m}_i} \mathsf{fix}\, x.\, t : \mathcal{S}}\ \texttt{t-fix}$$

The set I in the typing rules above can be empty. For example, when $I = \varnothing$ in rule $\texttt{t-abs}$, we obtain a judgment of the form $\varnothing; \varnothing \vdash^{[]} \lambda x.\, t : []^{\mathsf{abs}}$ with no premises. As we discussed at the beginning of this subsection, this result is because the abstraction is not used in the program. When $I = \varnothing$ in rule $\texttt{t-fix}$, it means that there are zero uses of the recursive calls in the program.

Moreover, $I = \varnothing$ in $\texttt{t-succ}$ we may encounter a special case that is the following:

$$\frac{\Phi; \Gamma \vdash^{\mathfrak{m}} t : []^{\mathsf{nat}}}{\Phi; \Gamma \vdash^{\mathfrak{m}} \mathbf{S}(t) : []^{\mathsf{nat}}}\ \texttt{t-succ} \qquad \frac{\Phi; \Gamma \vdash^{\mathfrak{m}} t : []^{\mathsf{nat}}}{\Phi; \Gamma \vdash^{\mathfrak{m}} \mathbf{S}(t) : [\mathbb{S}([]^{\mathsf{nat}})]^{\mathsf{nat}}}\ \texttt{t-succ}$$

Note that there may be several ways to split a nat-multitype $\mathcal{N}$ into a sum $+_{i \in I} \mathcal{N}_i$ of nat-multitypes $\mathcal{N}_i$ in rule $\texttt{t-succ}$. Therefore, this rule is non-deterministic when read from top to bottom.

A **(typing) derivation** is a tree obtained by applying the rules above. We write $\pi \triangleright \Phi; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$ when π is a derivation of the judgment $\Phi; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$.

As anticipated in the introduction, the hybrid CBN/CBV operational nature of PCFʜ is reflected in the quantitative type system. This is apparent by comparing the typing rules of system $\mathcal{H}$ with the rules of quantitative type systems for CBN/CBV in the literature. To see this formal resemblance more clearly, consider for example the CBN quantitative type system $\mathcal{N}$ and the CBV quantitative type system $\mathcal{V}$, both described in [20]. Rule $\texttt{t-var}_1$ of $\mathcal{H}$ types variables involved in CBV computations, aligning with rule $\mathsf{var}_{\mathsf{c}}^{\mathcal{V}}$ of $\mathcal{V}$. Conversely, rule $\texttt{t-var}_2$ types variables involved in CBN computations, corresponding to rule $\mathsf{var}_{\mathsf{c}}$ of $\mathcal{N}$. The typing rule for abstractions, $\texttt{t-abs}$, coincides with rule $\mathsf{abs}_{\mathsf{c}}^{\mathcal{V}}$ of $\mathcal{V}$. The multitype in the conclusion of rule $\texttt{t-abs}$ corresponds to the number of times an abstraction is *used*, as in quantitative type systems for CBV [12], rather than to the number of times the abstraction duplicates its argument, as in quantitative type systems for CBN [17, 8], reflecting the fact that function applications in PCFʜ are evaluated like in CBV. Conversely, in rule $\texttt{t-fix}$ the cardinality of the multitype family $\{\!\{\mathcal{T}_i\}\!\}_{i \in I}$ corresponds intuitively to the number of recursive calls, *i.e.* to the number of times that the fixed-point operator duplicates itself, which is similar to the typing rule of an application in CBN.

The goal of providing PCFʜ with such system is to characterize normalization of its evaluation strategy, so, as we briefly mentioned above, the purpose of multi-counters $\mathfrak{m}$ in $\mathcal{H}$ is to provide *upper bounds* for the number of evaluation steps to normal form by means of its cardinality. However, we would also like system $\mathcal{H}$ to go beyond this, by giving *exact bounds*, and for that, we make use of special derivations called *tight*. A multitype is **tight** if it is of the form $[]^{\nu}$. A derivation $\pi \triangleright \Phi; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$ is **tight** if Φ and Γ are both empty and if the multitype $\mathcal{T}$ is tight.

For example, the following derivation types the term $\lambda x.\, x\, \mathbf{0}$:

$$\frac{\dfrac{\overline{\varnothing; x : [[]^{\mathsf{nat}} \to []^{\mathsf{abs}}]^{\mathsf{abs}} \vdash^{[]} x : [[]^{\mathsf{nat}} \to []^{\mathsf{abs}}]^{\mathsf{abs}}}\ \texttt{t-var}_1 \qquad \overline{\varnothing; \varnothing \vdash^{[]} \mathbf{0} : []^{\mathsf{nat}}}\ \texttt{t-zero}}{\varnothing; x : [[]^{\mathsf{abs}} \to []^{\mathsf{nat}}]^{\mathsf{abs}} \vdash^{[\mathsf{B}]} x\, \mathbf{0} : [[]^{\mathsf{abs}}]^{\mathsf{abs}}}\ \texttt{t-app}}{\varnothing; \varnothing \vdash^{[\mathsf{B}]} \lambda x.\, x\, \mathbf{0} : [[[]^{\mathsf{nat}} \to []^{\mathsf{abs}}]^{\mathsf{abs}} \to []^{\mathsf{abs}}]^{\mathsf{abs}}}\ \texttt{t-abs}$$

and the derivation is not tight since the resulting multitype for the term is not empty. Moreover, the multi-counter is not an exact bound but rather an upper bound, given that this term is a normal form.

On the other hand, we can also build a *tight* derivation for the same term, ending in $\varnothing; \varnothing \vdash^{[\,]} \lambda x.\, x\, \mathbf{0} : [\,]^{\mathsf{abs}}$ by rule `t-abs` with no premises. Furthermore, the multi-counter here provides an exact bound.

Controlled weakening   As mentioned in the introduction, due to their quantitative nature, non-idempotent intersection type systems are *resource-aware*. In consonance with this, system $\mathcal{H}$ is *linear*, hence every single type assumption is used only once. However, in two specific points a controlled form of *weakening* is needed, namely in the `t-app` and `t-ifSucc` rules, reflected in the premises that contain the subsumption relation $\mathcal{T}^? \lhd \mathcal{T}$. This allows a variable to be bound to a value which is then *discarded* without being used. Observe that the subsumption relation $\lhd$ is used for controlling the CBV-like behavior. For example, in a term like $(\lambda x.\, \mathbf{0})\, t$, the argument t must be fully evaluated to a value before the application can proceed. Since system $\mathcal{H}$ intends to characterize normalization, this means that t must be typed to ensure that it is normalizing. If the type of t is $\mathcal{T}$ then, in principle, x should also be of type $\mathcal{T}$. But by linearity, $\mathbf{0}$ is only typable under the empty typing contexts. Assuming that t is a closed term of type $[\,]^{\mathsf{nat}}$, a type derivation can be given as follows:

$$
\cfrac{
\cfrac{
\cfrac{}{\varnothing; \varnothing, x : \bot \vdash^{[\,]} \mathbf{0} : [\,]^{\mathsf{nat}}} \ \text{\small t-zero}
}{
\varnothing; \varnothing \vdash^{[\,]} \lambda x.\, \mathbf{0} : [\bot \to [\,]^{\mathsf{nat}}]^{\mathsf{abs}}
} \ \text{\small t-abs}
\qquad
\bot \lhd [\,]^{\mathsf{nat}}
\qquad
\cfrac{\vdots}{\varnothing; \varnothing \vdash^{\mathbf{m}} t : [\,]^{\mathsf{nat}}}
}{
\varnothing; \varnothing \vdash^{[\mathsf{B}] + \mathbf{m}} (\lambda x.\, \mathbf{0})\, t : [\,]^{\mathsf{nat}}
} \ \text{\small t-app}
$$

Note that $\bot \lhd [\,]^{\mathsf{nat}}$ implies the hypothesis $x : \bot$ appears on the typing judgment of $\mathbf{0}$, while it forces the argument t on the right premise to be typable. Also, recall that $\varnothing, x : \bot$ is equal to $\varnothing$.

Let us now give an example of a type derivation for fixed-point operators, so let $t :=$ $(\mathsf{fix}\, f.\, \lambda n.\, \mathsf{if}(n, \mathbf{0}, m.\, \mathbf{S}(\mathbf{S}(f\, m))))\, \mathbf{S}(\mathbf{0})$, where the left subterm is a function returning the double of any natural number: *e.g.* t computes the double of $\mathbf{S}(\mathbf{S}(\mathbf{0}))$. Let $\mathcal{N} := [\mathbb{S}([\mathbb{0}]^{\mathsf{nat}})]^{\mathsf{nat}}$, $\mathcal{M} :=$ $[\mathbb{0}]^{\mathsf{nat}}$, $\mathcal{A} := [\mathcal{N} \to [\,]^{\mathsf{nat}}]^{\mathsf{abs}}$ and $\mathcal{B} := [\mathcal{M} \to [\,]^{\mathsf{nat}}]^{\mathsf{abs}}$.

A tight type derivation for t follows:

$$
\cfrac{
\pi_{\mathrm{rec1}}
\qquad
\cfrac{
\cfrac{}{\varnothing; \varnothing \vdash^{[\,]} \mathbf{0} : \mathcal{M}} \ \text{\small t-zero}
}{
\varnothing; \varnothing \vdash^{[\,]} \mathbf{S}(\mathbf{0}) : \mathcal{N}
} \ \text{\small t-succ}
}{
\varnothing; \varnothing \vdash^{[\mathsf{B},\mathsf{F},\mathsf{IS},\mathsf{B},\mathsf{F},\mathsf{IO}]} (\mathsf{fix}\, f.\, \lambda n.\, \mathsf{if}(n, \mathbf{0}, m.\, \mathbf{S}(\mathbf{S}(f\, m))))\, \mathbf{S}(\mathbf{0}) : [\,]^{\mathsf{nat}}
} \ \text{\small t-app}
$$

Note that the argument $\mathbf{S}(\mathbf{0})$ is typed with the singleton nat-multitype $\mathcal{N}$. This reflects the single use of $\mathbf{S}(\mathbf{0})$, as it corresponds to a single occurrence of n tested for zero equality. Moreover, its subterm $\mathbf{0}$ is assigned the singleton nat-multitype $\mathcal{M}$, since it is bound to a single occurrence of n which is also tested for zero equality in the base case of the recursive function.

The typing derivation for the left subterm (the fixed-point operator) follows:

$$
\pi_{\mathrm{rec1}} :=
\left(
\cfrac{
\cfrac{
\cfrac{
\cfrac{}{\varnothing; n : \mathcal{N} \vdash^{[\,]} n : \mathcal{N}} \ \text{\small t-var}_1
\qquad
\pi_{\mathrm{cond}}
}{
f : \{\!\{\mathcal{B}\}\!\}; n : \mathcal{N} \vdash^{[\mathsf{IS},\mathsf{B}]} \mathsf{if}(n, \mathbf{0}, m.\, \mathbf{S}(\mathbf{S}(f\, m))) : [\,]^{\mathsf{nat}}
} \ \text{\small t-ifSucc}
}{
f : \{\!\{\mathcal{B}\}\!\}; \varnothing \vdash^{[\mathsf{IS},\mathsf{B}]} \lambda n.\, \mathsf{if}(n, \mathbf{0}, m.\, \mathbf{S}(\mathbf{S}(f\, m))) : \mathcal{A}
} \ \text{\small t-abs}
\qquad
\pi_{\mathrm{rec2}}
}{
\varnothing; \varnothing \vdash^{[\mathsf{F},\mathsf{IS},\mathsf{B},\mathsf{F},\mathsf{IO}]} \mathsf{fix}\, f.\, \lambda n.\, \mathsf{if}(n, \mathbf{0}, m.\, \mathbf{S}(\mathbf{S}(f\, m))) : \mathcal{A}
} \ \text{\small t-fix}
\right)
$$

on which the function $\lambda n.\,\mathsf{if}(n,\mathbf{0},m.\,\mathbf{S}(\mathbf{S}(f\,m)))$ must be typed considering that n shall be bound to $\mathbf{S}(\mathbf{0})$, so that n is of type $\mathcal{N}$. Moreover, f is bound to the result of the recursive call, typed in π_{rec2}:

$$\pi_{\mathrm{rec2}} := \left(\dfrac{\dfrac{\dfrac{\overline{\varnothing;n:\mathcal{M}\vdash^{[]} n:\mathcal{M}}\ \texttt{t-var}_1 \quad \overline{\varnothing;\varnothing\vdash^{[]} \mathbf{0}:[]^{\mathsf{nat}}}\ \texttt{t-zero}}{\varnothing;n:\mathcal{M}\vdash^{[\mathtt{IO}]}\mathsf{if}(n,\mathbf{0},m.\,\mathbf{S}(\mathbf{S}(f\,m))):[]^{\mathsf{nat}}}\ \texttt{t-ifZero}}{\varnothing;\varnothing\vdash^{[\mathtt{IO}]}\lambda n.\,\mathsf{if}(n,\mathbf{0},m.\,\mathbf{S}(\mathbf{S}(f\,m))):\mathcal{B}}\ \texttt{t-abs}}{\varnothing;\varnothing\vdash^{[\mathtt{F},\mathtt{IO}]}\mathsf{fix}\,f.\,\lambda n.\,\mathsf{if}(n,\mathbf{0},m.\,\mathbf{S}(\mathbf{S}(f\,m))):\mathcal{B}}\ \texttt{t-fix} \right)$$

This derivation is the one in charge of typing the base case, hence $\lambda n.\,\mathsf{if}(n,\mathbf{0},m.\,\mathbf{S}(\mathbf{S}(f\,m)))$ is typed considering that n is bound to $\mathbf{0}$, so that n is of type $\mathcal{M}$. Since π_{rec2} corresponds to a base case, there are no right premises in the rule $\texttt{t-fix}$.

We finish with the derivation of the *else* branch of the conditional:

$$\pi_{\mathrm{cond}} := \left(\dfrac{\dfrac{\dfrac{\overline{f:\{\!\{\mathcal{B}\}\!\};\varnothing\vdash^{[]} f:\mathcal{B}}\ \texttt{t-var}_2 \quad \overline{\varnothing;m:\mathcal{M}\vdash^{[]} m:\mathcal{M}}\ \texttt{t-var}_1}{f:\{\!\{\mathcal{B}\}\!\};m:\mathcal{M}\vdash^{[\mathtt{B}]} f\,m:[]^{\mathsf{nat}}}\ \texttt{t-app}}{f:\{\!\{\mathcal{B}\}\!\};m:\mathcal{M}\vdash^{[\mathtt{B}]}\mathbf{S}(f\,m):[]^{\mathsf{nat}}}\ \texttt{t-succ}}{f:\{\!\{\mathcal{B}\}\!\};m:\mathcal{M}\vdash^{[\mathtt{B}]}\mathbf{S}(\mathbf{S}(f\,m)):[]^{\mathsf{nat}}}\ \texttt{t-succ} \right)$$

here, the term $\mathbf{S}(\mathbf{S}(f\,m))$ represents the result of doubling $\mathbf{S}(\mathbf{0})$, which is the normal form of t. As the normal form is not "used" in any way (*i.e.* there are no further interactions with the environment), it is typed with $[]^{\mathsf{nat}}$.

3.2   Properties of $\mathcal{H}$

This subsection develops the meta-theory of system $\mathcal{H}$ and proves the main results of this work. We begin by studying basic properties of the typing system, such as relevance and splitting lemmas. Then, we state auxiliary lemmas to prove soundness for system $\mathcal{H}$, as well as auxiliary lemmas to prove completeness.

A first remark states that a natural number must be typed with a nat-multitype:

Remark 4. If $\Phi;\Gamma\vdash^{\mathfrak{m}}\mathbf{k}:\mathcal{T}$, then $\mathcal{T}$ is of the form $\mathcal{N}$.

Recall that System $\mathcal{H}$ is linear so, in particular, all assumptions are used. This property is known as *relevance*:

Lemma 5 (Relevance)**.** *If* $\pi\triangleright\Phi;\Gamma\vdash^{\mathfrak{m}} t:\mathcal{T}$ *then* $\mathsf{dom}(\Phi)\cup\mathsf{dom}(\Gamma)\subseteq\mathsf{fv}(t)$.

Proof. The proof is straightforward by induction on π. $\qquad\qquad\square$

The next lemma establishes the equivalence between two different conditions regarding the typability of a value. Specifically, it states that a value is typable with a family context, a typing context, and a multi-counter that are empty if and only if it is typed with an empty ν-multiset, for any proper nature ν.

Lemma 6. *Let* $\mathbf{v}$ *be a value. Then the following are equivalent:*

1. $\Phi;\Gamma\vdash^{\mathfrak{m}}\mathbf{v}:[]^{\nu}$, *where* $\nu=\mathsf{abs}$ *if* $\mathbf{v}$ *is an abstraction, and* $\nu=\mathsf{nat}$ *if* $\mathbf{v}=\mathbf{k}$

2. $\Phi=\varnothing$, $\Gamma=\varnothing$ *and* $\mathfrak{m}=[]$

11

Proof. We prove both items by induction on $\mathbf{v}$. Cases $\mathbf{v} = \lambda x.\,t$ and $\mathbf{v} = \mathbf{0}$ are trivial. Case $\mathbf{v} = \mathbf{S}(\mathbf{l})$ is straightforward using the IH. $\qquad\square$

The following property establishes a form of stability of the subsumption relation concerning the sum operator.

Lemma 7 (Multitype Splitting Lemma). *The following hold:*

1. *If $\perp \vartriangleleft \mathcal{T}$ then $\mathcal{T}$ is of the form $[\,]^{\nu}$ for some proper nature ν.*

2. *$\mathcal{T}_1^? + \mathcal{T}_2^? \vartriangleleft \mathcal{T}$ if and only if there exist multitypes $\mathcal{T}_1, \mathcal{T}_2$ such that $\mathcal{T} = \mathcal{T}_1 + \mathcal{T}_2$ and $\mathcal{T}_i^? \vartriangleleft \mathcal{T}_i$ for all $i \in \{1, 2\}$.*

3. *$+_{i \in I} \mathcal{T}_i^? \vartriangleleft \mathcal{T}$ if and only if either I is empty and $\mathcal{T} = [\,]^{\nu}$ for some proper nature ν, or I is non-empty and there exist multitypes $(\mathcal{T}_i)_{i \in I}$ such that $\mathcal{T} = +_{i \in I} \mathcal{T}_i$ and $\mathcal{T}_i^? \vartriangleleft \mathcal{T}_i$ for all $i \in I$.*

The Multitype Splitting Lemma is used to split and merge the type derivation of values:

Lemma 8 (Generalized Value Splitting / Merging). *Let I be a finite set, $(\mathcal{T}_i^?)_{i \in I}$ a family of optional multitypes and $(\mathcal{F}_i)_{i \in I}$ a family of multitype families. Then the following are equivalent:*

1. *$\pi \vartriangleright \Phi; \Gamma \vdash^{\mathbf{m}} \mathbf{v} : \mathcal{T}$ with $\mathcal{T}$ a multitype such that $+_{i \in I} \mathcal{T}_i^? \vartriangleleft \mathcal{T}$*

2. *There exist family contexts $(\Phi_i)_{i \in I}$, typing contexts $(\Gamma_i)_{i \in I}$, multi-counters $(\mathfrak{m}_i)_{i \in I}$ and multitypes $(\mathcal{T}_i)_{i \in I}$ such that $\Phi = +_{i \in I} \Phi_i$ and $\Gamma = +_{i \in I} \Gamma_i$ and $\mathfrak{m} = +_{i \in I} \mathfrak{m}_i$ and $\pi_i \vartriangleright \Phi_i; \Gamma_i \vdash \mathbf{v} : \mathcal{T}_i$ and $\mathcal{T}_i^? \vartriangleleft \mathcal{T}_i$ for all $i \in I$.*

Proof. The proof is straightforward by induction on the cardinality of I, using Lemma 19. $\quad\square$

3.2.1 Lemmas for Soundness

To show that the type system $\mathcal{H}$ is sound, we follow well-known techniques for non-idempotent types (see [7, 2]). First, a Subject Reduction lemma is established, which is in turn based on two substitution lemmas: one for each kind of substitution that PCFʜ has.

Lemma 9 (Value Substitution Lemma). *Let $\zeta \vartriangleright \Psi; \Delta \vdash^{\mathbf{n}} \mathbf{v} : \mathcal{S}$ and let $\mathcal{S}^?$ be such that $\mathcal{S}^? \vartriangleleft \mathcal{S}$. If $\pi \vartriangleright \Phi; \Gamma, x : \mathcal{S}^? \vdash^{\mathbf{m}} t : \mathcal{T}$ then there exists a derivation π' such that $\pi' \vartriangleright \Phi + \Psi; \Gamma + \Delta \vdash^{\mathbf{m} + \mathbf{n}} t\{x := \mathbf{v}\} : \mathcal{T}$.*

Lemma 10 (Substitution Lemma). *Let I be a finite set, and $(\zeta_i \vartriangleright \Psi_i; \Delta_i \vdash^{\mathbf{n}_i} q : \mathcal{S}_i)_{i \in I}$ a family of type derivations. If $\pi \vartriangleright \Phi, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I}; \Gamma \vdash^{\mathbf{m}} t : \mathcal{T}$ then there exists a derivation π' such that $\pi' \vartriangleright \Phi +_{i \in I} \Psi_i; \Gamma +_{i \in I} \Delta_i \vdash^{\mathbf{m} +_{i \in I} \mathbf{n}_i} t\{x := q\} : \mathcal{T}$.*

Both substitution lemmas are proved by induction on π. Details are in Appendix B.

Now we move to Subject Reduction, which gives preservation of types. Moreover, it also provides quantitative information in the sense that the multi-counter for typing t' is smaller than the multi-counter for typing t, by exactly one element.

Lemma 11 (Subject Reduction). *Let t be such that $t \to_{\rho} t'$ and $\pi \vartriangleright \Phi; \Gamma \vdash^{\mathbf{m}} t : \mathcal{T}$. Then there exist a derivation π' and a multi-counter $\mathfrak{m}'$ such that $[\rho] + \mathfrak{m}' = \mathfrak{m}$ and $\pi' \vartriangleright \Phi; \Gamma \vdash^{\mathbf{m}'} t' : \mathcal{T}$.*

Proof. By induction on the derivation of $t \to_{\rho} t'$. We show only cases `r-beta` and `r-fix` to see how the substitution lemmas are applied; the remaining cases are in Appendix B.

- r-beta. Then $t = (\lambda x.\, s)\, \mathbf{v} \to_{\mathtt{B}} s\{x := \mathbf{v}\} = t'$. The conclusion of π can then only be derived using rule t-app, so π has the form:

$$\dfrac{\dfrac{\pi_1 \rhd \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}_1} s : \mathcal{T}}{\Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1} \lambda x.\, s : [\mathcal{S}^? \to \mathcal{T}]^{\mathsf{abs}}}\ \mathtt{t\text{-}abs} \quad (1)\ \mathcal{S}^? \lhd \mathcal{S} \quad \pi_2 \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} \mathbf{v} : \mathcal{S}}{\Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{[\mathtt{B}]+\mathfrak{m}_1+\mathfrak{m}_2} (\lambda x.\, s)\, \mathbf{v} : \mathcal{T}}\ \mathtt{t\text{-}app}$$

  where $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = [\mathtt{B}] + \mathfrak{m}_1 + \mathfrak{m}_2$. Given (1), we can apply Lemma 9 to π_1 with π_2, yielding $\pi' \rhd \Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{\mathfrak{m}_1+\mathfrak{m}_2} s\{x := \mathbf{v}\} : \mathcal{T}$, and we conclude with $\mathfrak{m}' = \mathfrak{m}_1 + \mathfrak{m}_2$, since $[\mathtt{B}] + \mathfrak{m}' = [\mathtt{B}] + \mathfrak{m}_1 + \mathfrak{m}_2 = \mathfrak{m}$.

- t-fix. Then $t = \mathsf{fix}\, x.\, s \to_\rho s\{x := \mathsf{fix}\, x.\, s\} = t'$. The conclusion of π can then only be derived by rule t-fix, so π has the form:

$$\dfrac{\pi_0 \rhd \Phi_0, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I}; \Gamma_0 \vdash^{\mathfrak{m}_0} s : \mathcal{T} \quad (\pi_i \rhd \Phi_i; \Gamma_i \vdash^{\mathfrak{m}_i} \mathsf{fix}\, x.\, s : \mathcal{S}_i)_{i \in I}}{\Phi_0 +_{i \in I} \Phi_i; \Gamma_0 +_{i \in I} \Gamma_i \vdash^{[\mathtt{F}]+\mathfrak{m}_0+_{i \in I}\mathfrak{m}_i} \mathsf{fix}\, x.\, s : \mathcal{T}}\ \mathtt{t\text{-}fix}$$

  where $\Phi = \Phi_0 +_{i \in I} \Phi_i$ and $\Gamma = \Gamma_0 +_{i \in I} \Gamma_i$ and $\mathfrak{m} = \mathfrak{m}_0 +_{i \in I} \mathfrak{m}_i$. By Lemma 10 on π_0 with $(\pi_i)_{i \in I}$ we obtain $\pi' \rhd \Phi_0 +_{i \in I} \Phi_i; \Gamma_0 +_{i \in I} \Gamma_i \vdash^{\mathfrak{m}_0+_{i \in I}\mathfrak{m}_i} s\{x := \mathsf{fix}\, x.\, s\} : \mathcal{T}$. We let $\mathfrak{m}' = \mathfrak{m}_0 +_{i \in I} \mathfrak{m}_i$ and we conclude since $[\mathtt{F}] + \mathfrak{m}' = [\mathtt{F}] + \mathfrak{m}_0 +_{i \in I} \mathfrak{m}_i = \mathfrak{m}$. $\square$

3.2.2 Lemmas for Completeness

To show that the type system $\mathcal{H}$ is complete, the procedure is analogous to the one to prove soundness. First, a Subject Expansion lemma is required, which is in turn based on two anti-substitution lemmas: one for each kind of substitution that PCF$\mathtt{H}$ has.

Lemma 12 (Value Anti-Substitution). *Let $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}} t\{x := \mathbf{v}\} : \mathcal{T}$. Then there exist family contexts Φ_1, Φ_2, typing contexts Γ_1, Γ_2, multi-counters $\mathfrak{m}_1$, $\mathfrak{m}_2$, an optional multitype $\mathcal{S}^?$ and a multitype $\mathcal{S}$ satisfying:*

1. *$\pi \rhd \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}_1} t : \mathcal{T}$*

2. *$\zeta \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} \mathbf{v} : \mathcal{S}$*

3. *$\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = \mathfrak{m}_1 + \mathfrak{m}_2$ and $\mathcal{S}^? \lhd \mathcal{S}$*

Lemma 13 (Anti-Substitution). *Let $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}} t\{x := q\} : \mathcal{T}$. Then there exist a finite set I, family contexts Φ_0, $(\Psi_i)_{i \in I}$, typing contexts Γ_0, $(\Delta_i)_{i \in I}$, multi-counters $\mathfrak{m}_0$, $(\mathfrak{n}_i)_{i \in I}$ and multitypes $(\mathcal{S}_i)_{i \in I}$ satisfying:*

1. *$\pi \rhd \Phi_0, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I}; \Gamma_0 \vdash^{\mathfrak{m}_0} t : \mathcal{T}$*

2. *$(\zeta_i \rhd \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} q : \mathcal{S}_i)_{i \in I}$*

3. *$\Phi = \Phi_0 +_{i \in I} \Psi_i$ and $\Gamma = \Gamma_0 +_{i \in I} \Delta_i$ and $\mathfrak{m} = \mathfrak{m}_0 +_{i \in I} \mathfrak{n}_i$*

Both anti-substitution lemmas are proved by induction on π. Details are in Appendix B.

We can proceed now to show Subject Expansion, which is analogous to Subject Reduction in Lemma 11. However, it goes in the opposite direction of the reduction relation $t \to_\rho t'$: given a type derivation of t', it proves that t has the same type as t'.

13

Lemma 14 (Subject Expansion). *Let $t \to_\rho t'$ and $\pi' \triangleright \Phi; \Gamma \vdash^{\mathfrak{m}'} t' : \mathcal{T}$. Then there exist a derivation π and a multi-counter $\mathfrak{m}$ such that $\mathfrak{m} = [\rho] + \mathfrak{m}'$ and $\Phi; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$.*

Proof. By induction on the derivation of $t \to_\rho t'$. Details are in Appendix B. $\qquad\square$

Furthermore, to prove completeness (*i.e.* normalization implies typability) it is necessary to show that non-stuck normal forms are typable. As stated in Section 2, the focus is only on proper normal forms since the stuck ones do not have any meaning, *i.e.* they represent computation errors that type systems such as $\mathcal{H}$ do not capture.

Lemma 15 (Normal Forms are Typable). *Let $t \in \mathsf{NF}_\nu$ with ν a proper nature. Then $\Phi; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$ for some $\mathfrak{m}, \Phi, \Gamma, \mathcal{T}$.*

Proof. See Appendix B for details. $\qquad\square$

We can even state a stronger result than the previous one, namely that proper normal forms can be obtained from a *tight* derivation. Moreover, the multi-counter of such tight derivations is empty, which is crucial to obtain exact bounds by tight type derivations:

Lemma 16 (Normal Forms are Tight Typable). *Let $t \in \mathsf{NF}_\nu$ with ν a proper nature. Then $\varnothing; \varnothing \vdash^{[]} t : []^\nu$.*

Proof. By induction on the derivation of $t \in \mathsf{NF}_\nu$. Recall cases `nf-app`, `nf-succ-stuck` and `nf-if` do not apply since `stuck` is not a proper nature.

1. `nf-abs`. Then $t = \lambda x.\, s \in \mathsf{NF}_{\mathsf{abs}}$ and indeed $\varnothing; \varnothing \vdash^{[]} \lambda x.\, s : []^{\mathsf{abs}}$ by `t-abs`.

2. `nf-zero`. Then $t = \mathbf{0} \in \mathsf{NF}_{\mathsf{nat}}$ and indeed $\varnothing; \varnothing \vdash^{[]} \mathbf{0} : []^{\mathsf{nat}}$ by `t-zero`.

3. `nf-succ-nat`. Then $t = \mathbf{S}(s) \in \mathsf{NF}_{\mathsf{nat}}$ where $s \in \mathsf{NF}_{\mathsf{nat}}$. By IH on $s \in \mathsf{NF}_{\mathsf{nat}}$, $\varnothing; \varnothing \vdash^{[]} s : []^{\mathsf{nat}}$, hence $\varnothing; \varnothing \vdash^{[]} \mathbf{S}(s) : []^{\mathsf{nat}}$ by applying `t-succ`. $\qquad\square$

3.2.3   Soundness and Completeness of System $\mathcal{H}$

We now turn to the main results of this paper, which are the properties of soundness and completeness of $\mathcal{H}$. Both properties give an equivalence between typability and normalization. The following theorem provides upper bounds for normalization sequences of a given term, for which no tightness condition is required:

Theorem 17 (Soundness and Completeness of System $\mathcal{H}$ with Upper Bounds). *Let t be a closed term, and ν be a proper nature. The following are equivalent:*

1. $\Phi; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$

2. *There exists a sequence of steps $t = t_0 \to_{\rho_1} t_1 \ldots \to_{\rho_n} t_n$ where $t_n \in \mathsf{NF}_\nu$ and $\#(\mathfrak{m}) \geq \#([\rho_1, \ldots, \rho_n])$.*

Proof.
$(1 \Rightarrow 2)$ By induction on the size of $\mathfrak{m}$, analyzing whether $t \in \mathsf{NF}_\nu$ or not.

- If $t \in \mathsf{NF}_\nu$, then t is of the form $\lambda x.\, s$, $\mathbf{0}$, or $\mathbf{S}(\mathbf{k})$, since ν is a proper nature. Hence t can only be derived by rule `t-abs`, `t-zero`, or `t-succ` respectively. In the three cases, we can take the empty evaluation sequence and we are done.

- If $t \notin \mathsf{NF}_\nu$. Then by Proposition 2 it must exist a term t' and a rule name ρ such that $t \to_\rho t'$. By Subject Reduction there exists $\mathfrak{m}'$ such that $\mathfrak{m} = [\rho] + \mathfrak{m}'$, and $\Phi; \Gamma \vdash^{\mathfrak{m}'} t' : \mathcal{T}$. By IH on $\mathfrak{m}'$, there exists a sequence of steps $t' \to_{\rho_1} t_1 \ldots \to_{\rho_n} t_n$ where $t_n \in \mathsf{NF}_\nu$ and $\#(\mathfrak{m}') \geq \#([\rho_1, \ldots, \rho_n])$. By joining this sequence with the step $t \to_\rho t'$ we obtain the sequence $t \to_\rho t' \to_{\rho_1} t_1 \ldots \to_{\rho_n} t_n$, where $\mathfrak{m} = [\rho] + \mathfrak{m}'$, and therefore $\#(\mathfrak{m}) \geq \#([\rho, \rho_1, \ldots, \rho_n])$.

$(2 \Rightarrow 1)$ By induction on n.

1. $n = 0$. Then $t \in \mathsf{NF}_\nu$, and we conclude with $\Phi; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$ by Lemma 15.

2. $n > 0$, assuming the property holds for $n-1$. Taking the reduction sequence of $(n-1)$ steps from t_1 to t_n, and $\#(\mathfrak{m}') \geq \#([\rho_2, \ldots, \rho_n])$ we can apply the IH, yielding $\Phi; \Gamma \vdash^{\mathfrak{m}'} t_1 : \mathcal{T}$. Since $t \to_{\rho_1} t_1$, then $\Phi; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$ by Subject Expansion, with $\mathfrak{m} = [\rho_1] + \mathfrak{m}'$, so we conclude with $\#(\mathfrak{m}) \geq \#([\rho_1, \rho_2, \ldots, \rho_n])$. □

Soundness and completeness of system $\mathcal{H}$ restricting type derivations to tight ones provide exact bounds for normalization sequences of a given term:

Theorem 18 (Tight Soundness and Completeness of System $\mathcal{H}$). *Let t be a closed term, and ν be a proper nature. The following are equivalent:*

1. $\varnothing; \varnothing \vdash^{\mathfrak{m}} t : [\,]^\nu$ *with π a tight derivation*

2. *There exists a sequence of steps $t = t_0 \to_{\rho_1} t_1 \ldots \to_{\rho_n} t_n$ where $t_n \in \mathsf{NF}_\nu$ and $\mathfrak{m} = [\rho_1, \ldots, \rho_n]$.*

Proof. Follows the same structure as in Theorem 17, *mutatis mutandis*. The full proof is in Appendix B.

To prove soundness $(1 \Rightarrow 2)$, in the case where $t \in \mathsf{NF}_\nu$, we know that t must be a value, hence the typing derivation $\varnothing; \varnothing \vdash^{\mathfrak{m}} t : [\,]^\nu$ of the hypothesis must be such that $\mathfrak{m} = [\,]$ by Lemma 6. To prove completeness $(2 \Rightarrow 1)$, we resort to the stronger Lemma 16, rather than just to Lemma 15, to ensure that we can construct a typing derivation of the form $\varnothing; \varnothing \vdash^{[\,]} t : [\,]^\nu$. □

4   Conclusions

This paper proposes a quantitative study of a hybrid evaluation strategy for PCF, called PCFʜ, without relying on any encoding of natural numbers or fixed-point operators.

Our key contribution is a quantitative semantics for PCFʜ, by means of a non-idempotent intersection type system called $\mathcal{H}$, which is sound and complete with respect to the strategy. System $\mathcal{H}$ highlights the hybrid nature of the PCFʜ semantics, in the sense that CBN and CBV quantitative behaviors coexist within the same framework. Moreover, not only $\mathcal{H}$ provides upper bounds for the length of normalization sequences to normal form, but we also achieve exact bounds by refining the typing derivations of $\mathcal{H}$ to those that are *tight*.

Frameworks such as CBPV or the *Bang Calculus* are able to *encode* both CBN and CBV cohesively, by distinguishing *values* from *computations*, instead of exhibiting explicitly the hybrid behavior they have. Therefore, it would be worth studying whether PCFʜ can be embedded into such calculi.

An interesting question is whether the quantitative information of other hybrid settings can be expressed using type systems such as $\mathcal{H}$. Another question for future work is the study of the inhabitation problem in a hybrid-type setting, which we conjecture to be decidable, given that it was already proven to be decidable in CBN [6], CBV, and CBPV [4].

Technical Appendix

A   Omitted proofs of Section 2

Lemma 1. *Let $t \in \mathsf{NF}_\varepsilon$. Then:*

1. *$\varepsilon = \mathsf{abs}$ if and only if t is of the form $\lambda x. s$,*

2. *$\varepsilon = \mathsf{nat}$ if and only if t is of the form $\mathbf{k}$.*

Proof. By induction on the derivation of the judgment $t \in \mathsf{NF}_\varepsilon$.

- `nf-abs`. Then $t = \lambda x. s \in \mathsf{NF}_{\mathsf{abs}}$, where $\varepsilon = \mathsf{abs}$. This case checks item 1.

- `nf-app`. Then $t = s\, u \in \mathsf{NF}_{\mathsf{stuck}}$, where $\varepsilon = \mathsf{stuck}$. This case trivially holds since t is not an abstraction nor $\mathbf{k}$, and also $\varepsilon \notin \{\mathsf{abs}, \mathsf{nat}\}$.

- `nf-zero`. Then $t = \mathbf{0} \in \mathsf{NF}_{\mathsf{nat}}$, where $\varepsilon = \mathsf{nat}$. This case checks item 2.

- `nf-succ-nat`. Then $t = \mathbf{S}(s) \in \mathsf{NF}_{\mathsf{nat}}$, where $\varepsilon = \mathsf{nat}$, and it is derived from $s \in \mathsf{NF}_{\mathsf{nat}}$. Then s is of the form $\mathbf{k}$ by the IH on s. Hence by definition, this case checks item 2.

- `nf-succ-stuck`. Then $t = \mathbf{S}(s) \in \mathsf{NF}_{\mathsf{stuck}}$, where $\varepsilon = \mathsf{stuck}$, and it is derived from $s \in \mathsf{NF}_{\varepsilon'}$, $\varepsilon' \neq \mathsf{nat}$. By the IH on s, s is not of the form $\mathbf{k}$. Hence by definition, $\mathbf{S}(s)$ is not an abstraction nor a $\mathbf{k}$, so this case also holds.

- `nf-if`. Then $t = \mathsf{if}(s, u, x. r) \in \mathsf{NF}_{\mathsf{stuck}}$, where $\varepsilon = \mathsf{stuck}$. This case trivially holds since $\varepsilon \notin \{\mathsf{abs}, \mathsf{nat}\}$ and t is not an abstraction nor of the form $\mathbf{k}$.

$\square$

Proposition 2 (Characterization of normal forms)**.** *For any closed term t the following are equivalent:*

1. *There exists a fallible nature ε such that $t \in \mathsf{NF}_\varepsilon$.*

2. *t is $\rightarrow$-irreducible.*

Proof.
$1 \Rightarrow 2$) By induction on the derivation of the judgment $t \in \mathsf{NF}_\varepsilon$. Note that cases `nf-abs` and `nf-zero` are immediate since there are no rules for reducing abstractions or zero.

- `nf-app`. Then $t = s\, u \in \mathsf{NF}_{\mathsf{stuck}}$ is derived from $s \in \mathsf{NF}_\varepsilon$ and $u \in \mathsf{NF}_{\varepsilon'}$, with $\varepsilon \neq \mathsf{abs}$. Hence s is $\rightarrow$-irreducible by IH on s, and u is $\rightarrow$-irreducible by IH on u. Moreover, it follows from Lemma 1 that s is not an abstraction since $\varepsilon \neq \mathsf{abs}$ by hypothesis. Therefore $s\, u$ is $\rightarrow$-irreducible since it is not a redex nor its subterms reduce.

- `nf-succ-nat`. Then $t = \mathbf{S}(u) \in \mathsf{NF}_{\mathsf{nat}}$ is derived from $u \in \mathsf{NF}_{\mathsf{nat}}$. The only rule to evaluate t is `r-succ`. But given that u is $\rightarrow$-irreducible by the IH on u, then $\mathbf{S}(u)$ does not reduce.

- `nf-succ-stuck`. Analogous to the previous case.

- `nf-if`. Then $t = \mathsf{if}(s, u, x. r) \in \mathsf{NF}_{\mathsf{stuck}}$ is derived from $s \in \mathsf{NF}_\varepsilon$, with $\varepsilon \neq \mathsf{nat}$. Hence s is $\rightarrow$-irreducible by IH on s. Moreover, it follows from Lemma 1 that s is not of the form $\mathbf{k}$ since $\varepsilon \neq \mathsf{nat}$ by hypothesis. Therefore $\mathsf{if}(s, u, x. r)$ is $\rightarrow$-irreducible since it is not a redex nor s reduces.
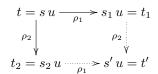

$2 \Rightarrow 1$) By induction on t, with t closed so that $t \neq x$. Note that case $t = \mathsf{fix}\, x.\, s$ is not possible since rule $\mathtt{r\text{-}fix}$ states that any term of the form $\mathsf{fix}\, x.\, s$ reduces.

- $t = \lambda x.\, s$. Assuming $\varepsilon = \mathsf{abs}$ and applying rule $\mathtt{nf\text{-}abs}$ then $\lambda x.\, s \in \mathsf{NF}_{\mathsf{abs}}$.

- $t = s\, u$. Since $s\, u$ is $\rightarrow$-irreducible, it follows that both s and u are also $\rightarrow$-irreducible, as otherwise t would reduce by rules $\mathtt{r\text{-}appL}$ or $\mathtt{r\text{-}appR}$. Consequently, there exists a fallible nature ε_1 such that $s \in \mathsf{NF}_{\varepsilon_1}$ and another fallible nature ε_2 such that $u \in \mathsf{NF}_{\varepsilon_2}$, by IH on s and u respectively. It is worth noting that s cannot be of the form $\lambda x.\, s'$, since otherwise t would reduce by rule $\mathtt{r\text{-}beta}$. Hence, it must be the case that $\varepsilon_1 \neq \mathsf{abs}$ by Lemma 1. Then $s\, u \in \mathsf{NF}_{\mathsf{stuck}}$ by applying rule $\mathtt{nf\text{-}app}$, with $\varepsilon = \mathsf{stuck}$.

- $t = \mathbf{0}$. Assuming $\varepsilon = \mathsf{nat}$ and applying rule $\mathtt{nf\text{-}zero}$ then $\mathbf{0} \in \mathsf{NF}_{\mathsf{nat}}$.

- $t = \mathbf{S}(s)$. Since $\mathbf{S}(s)$ is $\rightarrow$-irreducible, it follows that s is also $\rightarrow$-irreducible, as otherwise t would reduce by rule $\mathtt{r\text{-}succ}$. Then there exists a fallible nature ε' such that $s \in \mathsf{NF}_{\varepsilon'}$ by IH on s. To conclude, we apply rule $\mathtt{nf\text{-}succ\text{-}nat}$ if $\varepsilon' = \mathsf{nat}$ or rule $\mathtt{nf\text{-}succ\text{-}stuck}$ otherwise, and derive $\mathbf{S}(s) \in \mathsf{NF}_{\mathsf{nat}}$ if $\varepsilon' = \mathsf{nat}$, otherwise $\mathbf{S}(s) \in \mathsf{NF}_{\mathsf{stuck}}$.

- $t = \mathsf{if}(s, u, x.\, r)$. Since $\mathsf{if}(s, u, x.\, r)$ is $\rightarrow$-irreducible, it follows that s is also $\rightarrow$-irreducible, as otherwise t would reduce by rule $\mathtt{r\text{-}if}$. Then there exists a fallible nature ε' such that $s \in \mathsf{NF}_{\varepsilon'}$ by IH on s. Moreover, s is not of the form $\mathbf{0}$ nor $\mathbf{S}(k)$, otherwise t would reduce by rule $\mathtt{r\text{-}if0}$ or $\mathtt{r\text{-}ifS}$, respectively. Therefore it must be the case that $\varepsilon' \neq \mathsf{nat}$ by Lemma 1. Then $\mathsf{if}(s, u, x.\, r) \in \mathsf{NF}_{\mathsf{stuck}}$ by applying rule $\mathtt{nf\text{-}if}$, with $\varepsilon = \mathsf{stuck}$.

$\square$

Proposition 3 (Diamond property)**.** *If $t \rightarrow_{\rho_1} t_1$ and $t \rightarrow_{\rho_2} t_2$ where $t_1 \neq t_2$ then there exists t' such that $t_1 \rightarrow_{\rho_2} t'$ and $t_2 \rightarrow_{\rho_1} t'$.*

Proof. By induction on t. Note cases $t = x$, $t = \lambda x.\, s$ and $t = \mathbf{0}$ are impossible by hypothesis.

- $t = s\, u$. We can reduce an application using rules $\mathtt{r\text{-}beta}$, $\mathtt{r\text{-}appL}$ and $\mathtt{r\text{-}appR}$, so we have the following cases:

  - $\mathtt{r\text{-}beta}/\mathtt{r\text{-}beta}$. This case does not apply since we would have that $t_1 = t_2$, which contradicts the hypothesis.

  - $\mathtt{r\text{-}beta}/\mathtt{r\text{-}appL}$. We have $t = (\lambda x.\, s')\, \mathbf{v} \rightarrow_{\mathtt{B}} s'\{x := \mathbf{v}\} = t_1$, where $s = \lambda x.\, s'$, $u = \mathbf{v}$, and $\rho_1 = \mathtt{B}$. On the other hand, $t = (\lambda x.\, s')\, \mathbf{v} \rightarrow_{\rho_2} s_2\, \mathbf{v} = t_2$ is derived from $\lambda x.\, s' \rightarrow_{\rho_2} s_2$, but this is not possible since there are no rules to reduce abstractions.

  - $\mathtt{r\text{-}beta}/\mathtt{r\text{-}appR}$. Analogous to the previous case.

  - $\mathtt{r\text{-}appL}/\mathtt{r\text{-}appL}$. We have $t = s\, u \rightarrow_{\rho_1} s_1\, u = t_1$ derived from $s \rightarrow_{\rho_1} s_1$, and we have $t = s\, u \rightarrow_{\rho_2} s_2\, u = t_2$ derived from $s \rightarrow_{\rho_2} s_2$, where $s_1 \neq s_2$ since $s_1\, u \neq s_2\, u$ by hypothesis. We apply the IH on s, yielding s' such that $s_1 \rightarrow_{\rho_2} s'$ and $s_2 \rightarrow_{\rho_1} s'$. Applying rule $\mathtt{r\text{-}appL}$ to both s_1 and s_2, we obtain $t_1 = s_1\, u \rightarrow_{\rho_2} s'\, u = t'$ and $t_2 = s_2\, u \rightarrow_{\rho_1} s'\, u = t'$ respectively. The following diagram summarizes the proof:

$$
\begin{array}{ccc}
t = s\, u & \xrightarrow{\ \ \rho_1\ \ } & s_1\, u = t_1 \\
{\scriptstyle \rho_2} \big\downarrow & & \big\downarrow {\scriptstyle \rho_2} \\
t_2 = s_2\, u & \dashrightarrow[\ \rho_1\ ] & s'\, u = t'
\end{array}
$$

– `r-appR`/`r-appR`. Analogous to the previous case.

– `r-appL`/`r-appR`. We have $t = s\,u \rightarrow_{\rho_1} s_1\,u = t_1$ derived from (1) $s \rightarrow_{\rho_1} s_1$, and on the other hand we have $t = s\,u \rightarrow_{\rho_2} s\,u_2 = t_2$ derived from (2) $u \rightarrow_{\rho_2} u_2$. Given (2), we can apply rule `r-appR` to $s_1\,u$, yielding $t_1 = s_1\,u \rightarrow_{\rho_2} s_1\,u_2 = t'$. Lastly, given (1), we can apply rule `r-appL` to $s\,u_2$, yielding $t_2 = s\,u_2 \rightarrow_{\rho_1} s_1\,u_2 = t'$. The following diagram summarizes the proof:

$$
\begin{array}{ccc}
t = s\,u & \xrightarrow{\ \rho_1\ } & s_1\,u = t_1 \\
\rho_2 \downarrow & & \downarrow \rho_2 \\
t_2 = s\,u_2 & \dashrightarrow[\rho_1] & s_1\,u_2 = t'
\end{array}
$$

• $t = \mathbf{S}(s)$. The only rule to reduce t is `r-succ`. Hence, we have $t = \mathbf{S}(s) \rightarrow_{\rho_1} \mathbf{S}(s_1) = t_1$, derived from $s \rightarrow_{\rho_1} s_1$, and on the other hand $t = \mathbf{S}(s) \rightarrow_{\rho_2} \mathbf{S}(s_2) = t_2$, derived from $s \rightarrow_{\rho_2} s_2$, where $s_1 \neq s_2$ since $\mathbf{S}(s_1) \neq \mathbf{S}(s_2)$ by hypothesis. We can apply the IH on s, yielding s' such that $s_1 \rightarrow_{\rho_2} s'$ and $s_2 \rightarrow_{\rho_1} s'$. Applying rule `r-succ` to both s_1 and s_2, we obtain $\mathbf{S}(s_1) \rightarrow_{\rho_2} \mathbf{S}(s')$ and $\mathbf{S}(s_2) \rightarrow_{\rho_1} \mathbf{S}(s')$, respectively. The following diagram summarizes the proof:

$$
\begin{array}{ccc}
t = \mathbf{S}(s) & \xrightarrow{\ \rho_1\ } & \mathbf{S}(s_1) = t_1 \\
\rho_2 \downarrow & & \downarrow \rho_2 \\
t_2 = \mathbf{S}(s_2) & \dashrightarrow[\rho_1] & \mathbf{S}(s') = t'
\end{array}
$$

• $t = \mathsf{if}(s, u, x.\,r)$. We can reduce t using rules `r-if0`, `r-ifS` and `r-if`, so we have the following cases:

– `r-if0`/`r-if0`. This case does not apply since it should be that $t_1 = t_2$, which contradicts the hypothesis.

– `r-ifS`/`r-ifS`. Analogous to the previous case.

– `r-if0`/`r-ifS`. This case is not possible since on the one hand we have $s = \mathbf{0}$ given that t reduces by rule `r-if0`, but on the other hand, $s = \mathbf{S}(\mathbf{k})$ since t also reduces by rule `r-ifS`.

– `r-if0`/`r-if`. We have $t = \mathsf{if}(\mathbf{0}, u, x.\,r) \rightarrow_{\texttt{I0}} u = t_1$, where $s = \mathbf{0}$ and $\rho_1 = \texttt{I0}$. On the other hand $t = \mathsf{if}(\mathbf{0}, u, x.\,r) \rightarrow_{\rho_2} \mathsf{if}(s_2, u, x.\,r) = t_2$ is derived from $\mathbf{0} \rightarrow_{\rho_2} s_2$, but this is not possible since there are no rules to reduce $\mathbf{0}$.

– `r-ifS`/`r-if`. We have $t = \mathsf{if}(\mathbf{S}(\mathbf{k}), u, x.\,r) \rightarrow_{\texttt{IS}} r\{x := \mathbf{k}\} = t_1$ where $s = \mathbf{S}(\mathbf{k})$ and $\rho_1 = \texttt{IS}$, and we have $t = \mathsf{if}(\mathbf{S}(\mathbf{k}), u, x.\,r) \rightarrow_{\rho_2} \mathsf{if}(s_2, u, x.\,r) = t_2$ derived from $\mathbf{S}(\mathbf{k}) \rightarrow_{\rho_2} s_2$. This reduction can only be derived by rule `r-succ`, hence $s_2 = \mathbf{S}(s_2')$, and the reduction is derived from $\mathbf{k} \rightarrow_{\rho_2} s_2'$, but this is not possible since $\mathbf{k}$ is a value.

– `r-if`/ `r-if`. We have $t = \mathsf{if}(s, u, x.\,r) \rightarrow_{\rho_1} \mathsf{if}(s_1, u, x.\,r) = t_1$ derived from $s \rightarrow_{\rho_1} s_1$, and we have $t = \mathsf{if}(s, u, x.\,r) \rightarrow_{\rho_2} \mathsf{if}(s_2, u, x.\,r) = t_2$ derived from $s \rightarrow_{\rho_2} s_2$, where $s_1 \neq s_2$ since $\mathsf{if}(s_1, u, x.\,r) \neq \mathsf{if}(s_2, u, x.\,r)$ by hypothesis. We apply the IH on s, yielding s' such that $s_1 \rightarrow_{\rho_2} s'$ and $s_2 \rightarrow_{\rho_1} s'$. Applying rule `r-if` to both s_1 and s_2, we obtain $t_1 = \mathsf{if}(s_1, u, x.\,r) \rightarrow_{\rho_2} \mathsf{if}(s', u, x.\,r) = t'$ and $t_2 = \mathsf{if}(s_2, u, x.\,r) \rightarrow_{\rho_1}$

$\mathsf{if}(s', u, x.\, r) = t'$ respectively. The following diagram summarizes the proof:

$$
\begin{array}{ccc}
t = \mathsf{if}(s, u, x.\, r) & \xrightarrow{\ \ \rho_1\ \ } & \mathsf{if}(s_1, u, x.\, r) = t_1 \\
\rho_2 \downarrow & & \downarrow \rho_2 \\
t_2 = \mathsf{if}(s_2, u, x.\, r) & \dashrightarrow{\rho_1} & \mathsf{if}(s', u, x.\, r) = t'
\end{array}
$$

- $t = \mathsf{fix}\, x.\, s$. This case does not apply since we would have that $t_1 = t_2$, which contradicts the hypothesis.

$\square$

B   Omitted proofs of Section 3

Let I and J be two sets. We write $I \uplus J$ to denote the **disjoint union** of I and J.

Lemma 7 (Multitype Splitting Lemma). *The following hold:*

1. *If $\bot \lhd \mathcal{T}$ then $\mathcal{T}$ is of the form $[\,]^\nu$ for some proper nature ν.*

2. *$\mathcal{T}_1^? + \mathcal{T}_2^? \lhd \mathcal{T}$ if and only if there exist multitypes $\mathcal{T}_1, \mathcal{T}_2$ such that $\mathcal{T} = \mathcal{T}_1 + \mathcal{T}_2$ and $\mathcal{T}_i^? \lhd \mathcal{T}_i$ for all $i \in \{1, 2\}$.*

3. *$+_{i \in I} \mathcal{T}_i^? \lhd \mathcal{T}$ if and only if either I is empty and $\mathcal{T} = [\,]^\nu$ for some proper nature ν, or I is non-empty and there exist multitypes $(\mathcal{T}_i)_{i \in I}$ such that $\mathcal{T} = +_{i \in I} \mathcal{T}_i$ and $\mathcal{T}_i^? \lhd \mathcal{T}_i$ for all $i \in I$.*

Proof. The first item is immediate by definition of $\lhd$. Both directions of the third item follow from the first two items by induction on the cardinality of I, which is a finite set. For the direction ($\Rightarrow$) of the second item, we consider four subcases, depending on whether each of $\mathcal{T}_1^?$ and $\mathcal{T}_2^?$ is $\bot$ or not. We only discuss three subcases, as two of them are symmetric:

- If $\mathcal{T}_1^? = \mathcal{T}_2^? = \bot$, then $\mathcal{T}_1^? + \mathcal{T}_2^? = \bot \lhd \mathcal{T}$ so $\mathcal{T}$ is of the form $[\,]^\nu$ for some proper nature ν. It suffices to take $\mathcal{T}_1 = \mathcal{T}_2 := [\,]^\nu$, as then $\mathcal{T} = [\,]^\nu = [\,]^\nu + [\,]^\nu = \mathcal{T}_1 + \mathcal{T}_2$, and $\mathcal{T}_i^? = \bot \lhd [\,]^\nu = \mathcal{T}_i$ for all $i \in \{1, 2\}$.

- If $\mathcal{T}_1^? \neq \bot$ and $\mathcal{T}_2^? = \bot$, then $\mathcal{T}_1^? + \mathcal{T}_2^? = \mathcal{T}_1^? + \bot = \mathcal{T}_1^? \lhd \mathcal{T}$. There are two subcases, depending on whether $\mathcal{T}$ is an abs-multitype or a nat-multitype. We only treat the first case, the second one being symmetric. Let $\mathcal{T}$ be of the form $[\mathbb{A}_i]_{i \in I}^{\mathsf{abs}}$. Then $\mathcal{T}_1^? = \mathcal{T} = [\mathbb{A}_i]_{i \in I}^{\mathsf{abs}}$ by definition of $\lhd$, since $\mathcal{T}_1^? \lhd \mathcal{T}$ and $\mathcal{T}_1^? \neq \bot$. It suffices to take $\mathcal{T}_1 := [\mathbb{A}_i]_{i \in I}^{\mathsf{abs}}$ and $\mathcal{T}_2 := [\,]^{\mathsf{abs}}$, as then $\mathcal{T} = [\mathbb{A}_i]_{i \in I}^{\mathsf{abs}} = [\mathbb{A}_i]_{i \in I}^{\mathsf{abs}} + [\,]^{\mathsf{abs}} = \mathcal{T}_1 + \mathcal{T}_2$, where $\mathcal{T}_1^? \lhd \mathcal{T}_1$ and $\mathcal{T}_2^? = \bot \lhd [\,]^{\mathsf{abs}}$.

- If $\mathcal{T}_1^? \neq \bot$ and $\mathcal{T}_2^? \neq \bot$, then since $\mathcal{T}_1^? + \mathcal{T}_2^?$ is well-defined we know that $\mathcal{T}_1^?$ and $\mathcal{T}_2^?$ must be compatible. There are two cases, depending on whether they are abs-multitypes or optional nat-multitypes. We only treat the first case, the second one being symmetric. Then there exist sets I, J such that $\mathcal{T}_1^? = [\mathbb{A}_i]_{i \in I}^{\mathsf{abs}}$ and $\mathcal{T}_2^? = [\mathbb{A}_j]_{j \in J}^{\mathsf{abs}}$. Furthermore, by hypothesis $\mathcal{T}_1^? + \mathcal{T}_2^? = [\mathbb{A}_k]_{k \in I \cup J}^{\mathsf{abs}} \lhd \mathcal{T}$, so $\mathcal{T} = [\mathbb{A}_k]_{k \in I \cup J}^{\mathsf{abs}}$, and it suffices to take $\mathcal{T}_1 := [\mathbb{A}_i]_{i \in I}^{\mathsf{abs}}$ and $\mathcal{T}_2 := [\mathbb{A}_j]_{j \in J}^{\mathsf{abs}}$.

For the direction ($\Leftarrow$), we want to show that if there exist multitypes $\mathcal{T}_1, \mathcal{T}_2$ such that $\mathcal{T} = \mathcal{T}_1 + \mathcal{T}_2$ and $\mathcal{T}_i^? \lhd \mathcal{T}_i$ for all $i \in \{1, 2\}$, then we have $\mathcal{T}_1^? + \mathcal{T}_2^? \lhd \mathcal{T}$, we consider four subcases again, depending on whether each of $\mathcal{T}_1$ and $\mathcal{T}_2$ are empty or not. The steps are analogous as the other direction. □

Lemma 19 (Value Splitting / Merging). *Let $\mathcal{T}_1^?, \mathcal{T}_2^?$ be optional multitypes, and let $\mathcal{F}_1, \mathcal{F}_2$ be multitype families. Then the following are equivalent:*

1. $\pi \rhd \Phi; \Gamma \vdash^{\mathfrak{m}} \mathbf{v} : \mathcal{T}$ *with $\mathcal{T}$ a multitype such that $\mathcal{T}_1^? + \mathcal{T}_2^? \lhd \mathcal{T}$*

2. *There exist family contexts Φ_1, Φ_2, typing contexts Γ_1, Γ_2, multi-counters $\mathfrak{m}_1, \mathfrak{m}_2$, and multitypes $\mathcal{T}_1, \mathcal{T}_2$ such that $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = \mathfrak{m}_1 + \mathfrak{m}_2$, and for all $i = 1, 2$, $\pi_i \rhd \Phi_i; \Gamma_i \vdash^{\mathfrak{m}_i} \mathbf{v} : \mathcal{T}_i$ and $\mathcal{T}_i^? \lhd \mathcal{T}_i$.*

Proof.
$1 \Rightarrow 2$) We proceed by induction on π. Since $\mathbf{v}$ is value, the only rules that apply are `t-abs`, `t-zero` and `t-succ`.

- `t-abs`. Then $\mathbf{v} = \lambda x.t$, and $\pi \rhd +_{i \in I} \Phi_i; +_{i \in I} \Gamma_i \vdash^{+_{i \in I} \mathfrak{m}_i} \lambda x.t : [\mathcal{S}_i^? \to \mathcal{U}_i]_{i \in I}^{\mathsf{abs}}$, where $\Phi = +_{i \in I} \Phi_i$ and $\Gamma = +_{i \in I} \Gamma_i$ and $\mathfrak{m} = +_{i \in I} \mathfrak{m}_i$ and $\mathcal{T} = [\mathcal{S}_i^? \to \mathcal{U}_i]_{i \in I}^{\mathsf{abs}}$. The judgment is derived from $\pi_i' \rhd \Phi_i; \Gamma_i, x : \mathcal{S}_i^? \vdash^{\mathfrak{m}_i} t : \mathcal{U}_i$ for each $i \in I$. Given that $\mathcal{T}_1^? + \mathcal{T}_2^? \lhd [\mathcal{S}_i^? \to \mathcal{U}_i]_{i \in I}^{\mathsf{abs}}$, then there are two subcases to analyze, depending on whether $\mathcal{T}$ is empty or not:

  - If $\mathcal{T} = [\,]$, then $\mathcal{T} = [\mathcal{S}_i^? \to \mathcal{U}_i]_{i \in I}^{\mathsf{abs}} = [\,]^{\mathsf{abs}}$, so $I = \varnothing$. Therefore π has no premises and moreover $\Phi = \varnothing$ and $\Gamma = \varnothing$ and $\mathfrak{m} = [\,]$. Taking $\Phi_1 = \Phi_2 := \varnothing$ and $\Gamma_1 = \Gamma_2 := \varnothing$ and $\mathfrak{m}_1 = \mathfrak{m}_2 := [\,]$ and $\mathcal{T}_1 = \mathcal{T}_2 := [\,]^{\mathsf{abs}}$, we obtain the derivations $\pi_1 \rhd \Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1} \lambda x.t : \mathcal{T}_1$ and $\pi_2 \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} \lambda x.t : \mathcal{T}_2$ by applying rule `t-abs`. Then $\mathcal{T}_1^? \lhd \mathcal{T}_1$ and $\mathcal{T}_2^? \lhd \mathcal{T}_2$ by Lemma 7 (item 2). It is trivial to check that the conditions hold, since $\pi_1 = \pi_2 = \pi$.

  - If $\mathcal{T} \neq [\,]$, then $I \neq \varnothing$, so we can split it as $I = I_1 \uplus I_2$ such that $\mathcal{T}_1 = [\mathcal{S}_i^? \to \mathcal{U}_i]_{i \in I_1}^{\mathsf{abs}}$ and $\mathcal{T}_2 = [\mathcal{S}_i^? \to \mathcal{U}_i]_{i \in I_2}^{\mathsf{abs}}$. Taking $\Phi_1 := +_{i \in I_1} \Phi_i$ and $\Phi_2 := +_{i \in I_2} \Phi_i$, and $\Gamma_1 := +_{i \in I_1} \Gamma_i$ and $\Gamma_2 := +_{i \in I_2} \Gamma_i$, and $\mathfrak{m}_1 := +_{i \in I_1} \mathfrak{m}_i$ and $\mathfrak{m}_2 := +_{i \in I_2} \mathfrak{m}_i$, and $\mathcal{T}_1 := [\mathcal{S}_i^? \to \mathcal{U}_i]_{i \in I_1}^{\mathsf{abs}}$ and $\mathcal{T}_2 := [\mathcal{S}_i^? \to \mathcal{U}_i]_{i \in I_2}^{\mathsf{abs}}$, we can then split $(\pi_i')_{i \in I}$ into $(\pi_i')_{i \in I_1}$ and $(\pi_i')_{i \in I_2}$. We can easily check that $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = \mathfrak{m}_1 + \mathfrak{m}_2$ and $\mathcal{T} = \mathcal{T}_1 + \mathcal{T}_2$. Applying rule `t-abs` to both groups of derivations, we obtain $\pi_1 \rhd \Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1} \lambda x.t : \mathcal{T}_1$ and $\pi_2 \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} \lambda x.t : \mathcal{T}_2$. And moreover $\mathcal{T}_1^? \lhd \mathcal{T}_1$ and $\mathcal{T}_2^? \lhd \mathcal{T}_2$ by Lemma 7 (item 2).

- `t-zero`. Then $\mathbf{v} = \mathbf{0}$ and $\pi \rhd \varnothing; \varnothing \vdash^{[\,]} \mathbf{0} : [\mathbb{0}]_{i \in I}^{\mathsf{nat}}$, where $\Phi = \varnothing$ and $\Gamma = \varnothing$ and $\mathfrak{m} = [\,]$ and $\mathcal{T} = [\mathbb{0}]_{i \in I}^{\mathsf{nat}}$. Since $\mathcal{T}_1^? + \mathcal{T}_2^? \lhd [\mathbb{0}]_{i \in I}^{\mathsf{nat}}$, there are two subcases to analyze, depending on whether $\mathcal{T}$ is empty or not:

  - If $\mathcal{T} = [\,]$, then $\mathcal{T}_1^? = \mathcal{T}_2^? = \bot$ and $[\mathbb{0}]_{i \in I}^{\mathsf{nat}} = [\,]^{\mathsf{nat}}$, so $I = \varnothing$. This subcase is analogous to the subcase $\mathcal{T} = [\,]$ for `t-abs`.

  - If $\mathcal{T} \neq [\,]$, then $I \neq \varnothing$, so we can split it as $I = I_1 \uplus I_2$ so that $[\mathbb{0}]_{i \in I}^{\mathsf{nat}} = [\mathbb{0}]_{i \in I_1}^{\mathsf{nat}} + [\mathbb{0}]_{i \in I_2}^{\mathsf{nat}}$. Moreover, there exist multitypes $\mathcal{T}_1, \mathcal{T}_2$ such that $\mathcal{T}_1^? \lhd \mathcal{T}_1$ and $\mathcal{T}_2^? \lhd \mathcal{T}_2$ by Lemma 7 (item 2). Taking $\Phi_1 = \Phi_2 := \varnothing$, and $\Gamma_1 = \Gamma_2 := \varnothing$, and $\mathfrak{m}_1 = \mathfrak{m}_2 := [\,]$, and $\mathcal{T}_1$ and $\mathcal{T}_2$, we check $\Phi = \varnothing = \Phi_1 + \Phi_2$ and $\Gamma = \varnothing = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = [\,] = \mathfrak{m}_1 + \mathfrak{m}_2$. By rule `t-zero` we obtain the derivations $\pi_1 \rhd \varnothing; \varnothing \vdash^{[\,]} \mathbf{0} : [\mathbb{0}]_{i \in I_1}^{\mathsf{nat}}$ and $\pi_2 \rhd \varnothing; \varnothing \vdash^{[\,]} \mathbf{0} : [\mathbb{0}]_{i \in I_2}^{\mathsf{nat}}$.

- t-succ. Then $\mathbf{v} = \mathbf{S(k)}$ and $\pi \rhd \Phi; \Gamma \vdash^{\mathbf{m}} \mathbf{S(k)} : [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I}$, where $\mathcal{T} = [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I}$. The judgment is derived from $\pi' \rhd \Phi; \Gamma \vdash^{\mathbf{m}} \mathbf{k} : +_{i \in I} \mathcal{N}_i$. Since $\mathcal{T}_1^? + \mathcal{T}_2^? \lhd [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I}$, there are two subcases to analyze, depending on whether $\mathcal{T}$ is empty or not:

  - Analogous to the subcase $\mathcal{T} = [\,]$ in cases t-abs and t-zero.
  - If $\mathcal{T} \neq [\,]$, then $I \neq \varnothing$, so we can split it as $I = I_1 \uplus I_2$ so that $[\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I} = [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I_1} + [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I_2} = \mathcal{T}_1 + \mathcal{T}_2$. Then $\mathcal{T}_1^? \lhd \mathcal{T}_1$ and $\mathcal{T}_2^? \lhd \mathcal{T}_2$ by Lemma 7 (item 2). Moreover, the premise can be written as $\pi' \rhd \Phi; \Gamma \vdash^{\mathbf{m}} \mathbf{k} : +_{i \in I_1} \mathcal{N}_i +_{i \in I_2} \mathcal{N}_i$, and $+_{i \in I_1} \mathcal{N}_i +_{i \in I_2} \mathcal{N}_i \lhd +_{i \in I_1} \mathcal{N}_i +_{i \in I_2} \mathcal{N}_i$ by definition. We can apply IH on π', yielding that there exist family contexts Φ_1, Φ_2, typing contexts Γ_1, Γ_2, multi-counters $\mathbf{m}_1$, $\mathbf{m}_2$ and multitypes $\mathcal{N}_1, \mathcal{N}_2$ such that $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathbf{m} = \mathbf{m}_1 + \mathbf{m}_2$, and the derivations $\pi_1' \rhd \Phi_1; \Gamma_1 \vdash^{\mathbf{m}_1} \mathbf{k} : \mathcal{N}_1$ and $\pi_2' \rhd \Phi_2; \Gamma_2 \vdash^{\mathbf{m}_2} \mathbf{k} : \mathcal{N}_2$ hold, with $+_{i \in I_1} \mathcal{N}_i \lhd \mathcal{N}_1$ and $+_{i \in I_2} \mathcal{N}_i \lhd \mathcal{N}_2$. Taking Φ_1, Φ_2 and Γ_1, Γ_2 and $\mathbf{m}_1, \mathbf{m}_2$ and the previously defined $\mathcal{T}_1 := [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I_1}$ and $\mathcal{T}_2 := [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I_2}$, then $\mathcal{T} = \mathcal{T}_1 + \mathcal{T}_2$; the remainder conditions are already checked in the IH. Applying rule t-succ to both π_1' and π_2', we obtain $\pi_1 \rhd \Phi_1; \Gamma_1 \vdash^{\mathbf{m}_1} \mathbf{S(k)} : \mathcal{T}_1$ and $\pi_2 \rhd \Phi_2; \Gamma_2 \vdash^{\mathbf{m}_2} \mathbf{S(k)} : \mathcal{T}_2$, with $\mathcal{T}_1^? \lhd \mathcal{T}_1$ and $\mathcal{T}_2^? \lhd \mathcal{T}_2$.

$2 \Rightarrow 1$) We proceed by induction on π_1 and π_2. Since $\mathbf{v}$ is value, the only rules that apply are t-abs, t-zero and t-succ.

- t-abs. Then $\mathbf{v} = \lambda x. t$, and we have sets I_1 and I_2 such that π_1 is of the form

$$\pi_1 := \frac{(\pi_i \rhd \Phi_i; \Gamma_i, x : \mathcal{S}_i^? \vdash^{\mathbf{m}_i} t : \mathcal{U}_i)_{i \in I_1}}{+_{i \in I_1} \Phi_i; +_{i \in I_1} \Gamma_i \vdash^{+_{i \in I_1} \mathbf{m}_i} \lambda x. t : [\mathcal{S}_i^? \rightarrow \mathcal{U}_i]^{\mathsf{abs}}_{i \in I_1}} \text{ t-abs}$$

where $\Phi_1 = +_{i \in I_1} \Phi_i$ and $\Gamma_1 = +_{i \in I_1} \Gamma_i$ and $\mathbf{m}_1 = +_{i \in I_1} \mathbf{m}_i$ and $\mathcal{T}_1 = [\mathcal{S}_i^? \rightarrow \mathcal{U}_i]^{\mathsf{abs}}_{i \in I_1}$. And on the other hand π_2 is of the form

$$\pi_2 := \frac{(\pi_i \rhd \Phi_i; \Gamma_i, x : \mathcal{S}_i^? \vdash^{\mathbf{m}_i} t : \mathcal{U}_i)_{i \in I_2}}{+_{i \in I_2} \Phi_i; +_{i \in I_2} \Gamma_i \vdash^{+_{i \in I_2} \mathbf{m}_i} \lambda x. t : [\mathcal{S}_i^? \rightarrow \mathcal{U}_i]^{\mathsf{abs}}_{i \in I_2}} \text{ t-abs}$$

where $\Phi_2 = +_{i \in I_2} \Phi_i$ and $\Gamma_2 = +_{i \in I_2} \Gamma_i$ $\mathbf{m}_2 = +_{i \in I_2} \mathbf{m}_i$ and and $\mathcal{T}_2 = [\mathcal{S}_i \rightarrow \mathcal{U}_i]^{\mathsf{abs}}_{i \in I_2}$. Moreover $\Phi = \Phi_1 + \Phi_2 = +_{i \in I_1} \Phi_i +_{i \in I_2} \Phi_i$ and $\Gamma = \Gamma_1 + \Gamma_2 = +_{i \in I_1} \Gamma_i +_{i \in I_2} \Gamma_i$ and $\mathbf{m} = \mathbf{m}_1 + \mathbf{m}_2 = +_{i \in I_1} \mathbf{m}_i +_{i \in I_2} \mathbf{m}_i$ and $\mathcal{T}_1^? \lhd [\mathcal{S}_i \rightarrow \mathcal{U}_i]^{\mathsf{abs}}_{i \in I_1}$ and $\mathcal{T}_2^? \lhd [\mathcal{S}_i \rightarrow \mathcal{U}_i]^{\mathsf{abs}}_{i \in I_2}$. By joining the premises of π_1 and π_2, and applying rule t-abs we yield

$$\pi := \left(\frac{(\pi_i \rhd); \Phi_i \vdash^{\mathbf{m}_i} \Gamma_i, x : \mathcal{S}_i^? : t \mathcal{U}_i)_{i \in I_1 \uplus I_2}}{+_{i \in I_1 \uplus I_2} \Phi_i; +_{i \in I_1 \uplus I_2} \Gamma_i \vdash^{+_{i \in I_1 \uplus I_2} \mathbf{m}_i} \lambda x. t : [\mathcal{S}_i^? \rightarrow \mathcal{U}_i]^{\mathsf{abs}}_{i \in I_1 \uplus I_2}} \text{ t-abs}_{\mathsf{v}} \right)$$

and $\mathcal{T}_1^? + \mathcal{T}_2^? \lhd [\mathcal{S}_i^? \rightarrow \mathcal{U}_i]^{\mathsf{abs}}_{i \in I_1 \uplus I_2}$ holds by Lemma 7 (item 3).

- t-zero. Analogous to the previous case.

- t-succ. Then $\mathbf{v} = \mathbf{S(k)}$, and we have sets I_1 and I_2 such that π_1 is of the form

$$\pi_1 := \frac{\pi_1' \rhd \Phi_1; \Gamma_1 \vdash^{\mathbf{m}_1} \mathbf{k} : +_{i \in I_1} \mathcal{N}_i}{\Phi_1; \Gamma_1 \vdash^{\mathbf{m}_1} \mathbf{S(k)} : [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I_1}} \text{ t-succ}$$

where $\mathcal{T}_1 = [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I_1}$. And on the other hand π_2 is of the form

$$\pi_2 := \frac{\pi_2' \triangleright \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} \mathbf{k} : +_{i \in I_2} \mathcal{N}_i}{\Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} \mathbf{S}(\mathbf{k}) : [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I_2}} \ \texttt{t-succ}$$

where $\mathcal{T}_2 = [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I_2}$. Moreover $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = \mathfrak{m}_1 + \mathfrak{m}_2$ and $\mathcal{T}_1^? \triangleleft [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I_1}$ and $\mathcal{T}_2^? \triangleleft [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I_2}$. Let $j = 1, 2$, then let us define the optional multitype $\mathcal{S}_j^?$ as

$$\mathcal{S}_j^? := \left\{ \begin{array}{ll} \bot & \text{if } \mathcal{T}_j^? = \bot \\ +_{i \in I_j} \mathcal{N}_i & \text{otherwise} \end{array} \right.$$

so that $\mathcal{S}_1^? \triangleleft +_{i \in I_1} \mathcal{N}_i$ and $\mathcal{S}_2^? \triangleleft +_{i \in I_2} \mathcal{N}_i$. We can apply the IH, yielding $\pi' \triangleright \Phi; \Gamma \vdash^{\mathfrak{m}} \mathbf{k} : \mathcal{N}$, where $\mathcal{S}_1^? + \mathcal{S}_2^? \triangleleft \mathcal{N}$. Moreover, $\mathcal{N} = +_{i \in I_1} \mathcal{N}_i +_{i \in I_2} \mathcal{N}_i$ by Lemma 7 (item 3). Applying rule $\texttt{t-succ}$, we conclude $\Phi; \Gamma \vdash^{\mathfrak{m}} \mathbf{S}(\mathbf{k}) : [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I_1 \uplus I_2}$.

$\square$

Lemma 9 (Value Substitution Lemma). *Let $\zeta \triangleright \Psi; \Delta \vdash^{\mathfrak{n}} \mathbf{v} : \mathcal{S}$ and let $\mathcal{S}^?$ be such that $\mathcal{S}^? \triangleleft \mathcal{S}$. If $\pi \triangleright \Phi; \Gamma, x : \mathcal{S}^? \vdash^{\mathfrak{m}} t : \mathcal{T}$ then there exists a derivation π' such that $\pi' \triangleright \Phi + \Psi; \Gamma + \Delta \vdash^{\mathfrak{m}+\mathfrak{n}} t\{x := \mathbf{v}\} : \mathcal{T}$.*

Proof. We proceed by induction on π.

1. $\texttt{t-var}_1$. Then $\pi \triangleright \varnothing; y : \mathcal{T} \vdash^{[]} y : \mathcal{T}$, where $\Phi = \varnothing$ and $(\Gamma, x : \mathcal{S}^?) = (y : \mathcal{T})$ and $\mathfrak{m} = []$ and $t = y$. We consider two subcases, depending on whether $x = y$ or not:

    1.1 If $x = y$, then $\Gamma = \varnothing$ and $\mathcal{S}^? = \mathcal{T}$. Since $\mathcal{S}^? = \mathcal{T} \triangleleft \mathcal{S}$, then $\mathcal{S} = \mathcal{T}$. We conclude by letting $\pi' := \zeta$.

    1.2 If $x \neq y$, then $\Gamma = (y : \mathcal{T})$ and thus $\mathcal{S}^? = \bot$. By hypothesis, $\zeta \triangleright \Psi; \Delta \vdash^{\mathfrak{n}} \mathbf{v} : \mathcal{S}$ and moreover $\mathcal{S}^? = \bot \triangleleft \mathcal{S}$, which means that $\mathcal{S}$ must be of the form $[]^\nu$ for some proper nature ν. Hence $\Psi = \varnothing$ and $\Delta = \varnothing$ and $\mathfrak{n} = []$ by Lemma 6. We conclude by letting $\pi' := \pi$.

2. $\texttt{t-var}_2$. Then $\pi \triangleright y : \{\!\{\mathcal{T}\}\!\}; \varnothing \vdash^{[]} y : \mathcal{T}$, where $\Phi = y : \{\!\{\mathcal{T}\}\!\}$ and $(\Gamma, x : \mathcal{S}^?) = \varnothing$ and $\mathfrak{m} = []$ and $t = y$. Moreover, $\Gamma = \varnothing$ and $\mathcal{S}^? = \bot$, since x must be different from y by the invariant. The rest of the proofs is analogous to subcase $x \neq y$ from $\texttt{t-var}_1$.

3. $\texttt{t-abs}$. Then $\pi \triangleright +_{i \in I} \Phi_i; +_{i \in I} \Gamma_i, x : +_{i \in I} \mathcal{S}_i^? \vdash^{+_{i \in I} \mathfrak{m}_i} \lambda y. s : [\mathcal{U}_i^? \to \mathcal{R}_i]^{\mathsf{abs}}_{i \in I}$, where $\Phi = +_{i \in I} \Phi_i$ and $\Gamma = +_{i \in I} \Gamma_i$ and $\mathcal{S}^? = +_{i \in I} \mathcal{S}_i^?$ and $\mathfrak{m} = +_{i \in I} \mathfrak{m}_i$ and $t = \lambda y. s$ and $\mathcal{T} = [\mathcal{U}_i^? \to \mathcal{R}_i]^{\mathsf{abs}}_{i \in I}$. The judgment is derived from $(\pi_i \triangleright \Phi_i; \Gamma_i, x : \mathcal{S}_i^?, y : \mathcal{U}_i^? \vdash^{\mathfrak{m}_i} s : \mathcal{R}_i)_{i \in I}$. Since $+_{i \in I} \mathcal{S}_i^? = \mathcal{S}^? \triangleleft \mathcal{S}$, then by Lemma 8 there exist family contexts $(\Psi_i)_{i \in I}$, typing contexts $(\Delta_i)_{i \in I}$, multi-counters $(\mathfrak{n}_i)_{i \in I}$ and multitypes $(\mathcal{S}_i)_{i \in I}$ such that $\Psi = +_{i \in I} \Psi_i$ and $\Delta = +_{i \in I} \Delta_i$ and $\mathfrak{n} = +_{i \in I} \mathfrak{n}_i$ and for all $i \in I$ $\zeta_i \triangleright \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} \mathbf{v} : \mathcal{S}_i$ and $\mathcal{S}_i^? \triangleleft \mathcal{S}_i$. We can apply the IH on π_i with ζ_i, yielding $(\pi_i' \triangleright \Phi_i + \Psi_i; (\Gamma_i, y : \mathcal{U}_i^?) + \Delta_i \vdash^{\mathfrak{m}_i + \mathfrak{n}_i} s\{x := \mathbf{v}\} : \mathcal{R}_i)_{i \in I}$. By Lemma 5 and α-conversion we can write $(\Gamma_i, y : \mathcal{U}_i^?) + \Delta_i$ as $(\Gamma_i + \Delta_i), y : \mathcal{U}_i^?$. Then we can apply rule $\texttt{t-abs}$ to $(\pi_i')_{i \in I}$, yielding $\pi' \triangleright +_{i \in I}(\Phi_i + \Psi_i); +_{i \in I}(\Gamma_i + \Delta_i) \vdash^{+_{i \in I}(\mathfrak{m}_i + \mathfrak{n}_i)} \lambda y. s\{x := \mathbf{v}\} : [\mathcal{U}_i^? \to \mathcal{R}_i]^{\mathsf{abs}}_{i \in I}$, and we are done since $\lambda y. s\{x := \mathbf{v}\} = (\lambda y. s)\{x := \mathbf{v}\}$.

4. $\texttt{t-app}$. Then $\pi \triangleright \Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2, x : \mathcal{S}_1^? + \mathcal{S}_2^? \vdash^{[\mathsf{B}] + \mathfrak{m}_1 + \mathfrak{m}_2} s\,u : \mathcal{T}$, where $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathcal{S}^? = \mathcal{S}_1^? + \mathcal{S}_2^?$ and $\mathfrak{m} = [\mathsf{B}] + \mathfrak{m}_1 + \mathfrak{m}_2$ and $t = s\,u$, and the judgment is derived from $\pi_1 \triangleright \Phi_1; \Gamma_1, x : \mathcal{S}_1^? \vdash^{\mathfrak{m}_1} s : [\mathcal{U}^? \to \mathcal{T}]^{\mathsf{abs}}$ and $\pi_2 \triangleright \Phi_2; \Gamma_2, x : \mathcal{S}_2^? \vdash^{\mathfrak{m}_2} u : \mathcal{U}$ and

(1) $\mathcal{U}^? \lhd \mathcal{U}$. By Lemma 19 there exist family contexts Ψ_1, Ψ_2, typing contexts Δ_1, Δ_2, multi-counters $\mathfrak{n}_1$, $\mathfrak{n}_2$ and multitypes $\mathcal{S}_1$, $\mathcal{S}_2$ such that $\Psi = \Psi_1 + \Psi_2$ and $\Delta = \Delta_1 + \Delta_2$ and $\mathfrak{n} = \mathfrak{n}_1 + \mathfrak{n}_2$ and for each $i = 1, 2$ we have $\zeta_i \rhd \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} \mathbf{v} : \mathcal{S}_i$ and $\mathcal{S}_i^? \lhd \mathcal{S}_i$. By IH on π_1 with ζ_1 and π_2 with ζ_2 we have $\pi_1' \rhd \Phi_1 + \Psi_1; \Gamma_1 + \Delta_1 \vdash^{\mathfrak{m}_1 + \mathfrak{n}_1} s\{x := \mathbf{v}\} : [\mathcal{U}^? \to \mathcal{T}]^{\mathsf{abs}}$ and $\pi_2' \rhd \Phi_2 + \Psi_2; \Gamma_2 + \Delta_2 \vdash^{\mathfrak{m}_2 + \mathfrak{n}_2} u\{x := \mathbf{v}\} : \mathcal{U}$. We can apply rule $\mathsf{t\text{-}app}$ with π_1', π_2' and (3) as premises, yielding $\pi' \rhd \Phi + \Psi; \Gamma + \Delta \vdash^{\mathfrak{m}+\mathfrak{n}} s\{x := \mathbf{v}\}\, u\{x := \mathbf{v}\} : \mathcal{T}$, and we are done since $s\{x := \mathbf{v}\}\, u\{x := \mathbf{v}\} = (s\, u)\{x := \mathbf{v}\}$.

5. $\mathsf{t\text{-}zero}$. Then $\pi \rhd \varnothing; \varnothing \vdash^{[\,]} \mathbf{0} : [\mathbb{0}]^{\mathsf{nat}}_{i \in I}$, where $\Phi = \varnothing$ and $\Gamma = \varnothing$ and $\mathcal{S}^? = \perp$ and $\mathfrak{m} = [\,]$ and $t = \mathbf{0}$ and $\mathcal{T} = [\mathbb{0}]^{\mathsf{nat}}_{i \in I}$. Since $\perp \lhd \mathcal{S}$, then $\mathcal{S}$ is of the form $[\,]^{\nu}$, for some proper nature ν. Moreover, $\Psi = \varnothing$ and $\Delta = \varnothing$ and $\mathfrak{n} = [\,]$ by Lemma 6. We conclude by letting $\pi' := \pi$, since $\mathbf{0}\{x := \mathbf{v}\} = \mathbf{0}$.

6. $\mathsf{t\text{-}succ}$. Then $\pi \rhd \Phi; \Gamma, x : \mathcal{S}^? \vdash^{\mathfrak{m}} \mathbf{S}(u) : [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I}$, where $t = \mathbf{S}(u)$ and $\mathcal{T} = [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I}$. The judgment is derived from $\pi_0 \rhd \Phi; \Gamma, x : \mathcal{S}^? \vdash^{\mathfrak{m}} u : +_{i \in I} \mathcal{N}_i$. Applying the IH on π_0 with ζ we obtain $\pi_0' \rhd \Phi + \Psi; \Gamma + \Delta \vdash^{\mathfrak{m}+\mathfrak{n}} u\{x := \mathbf{v}\} : +_{i \in I} \mathcal{N}_i$. Applying rule $\mathsf{t\text{-}succ}$ we conclude with $\pi' \rhd \Phi + \Psi; \Gamma + \Delta \vdash^{\mathfrak{m}+\mathfrak{n}} \mathbf{S}(u\{x := \mathbf{v}\}) : [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I}$, and we are done since $\mathbf{S}(u\{x := \mathbf{v}\}) = (\mathbf{S}(u))\{x := \mathbf{v}\}$.

7. $\mathsf{t\text{-}ifZero}$. Then $\pi \rhd \Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2, x : \mathcal{S}_1^? + \mathcal{S}_2^? \vdash^{[\mathsf{I0}]+\mathfrak{m}_1+\mathfrak{m}_2} \mathsf{if}(s, u, y.\, r) : \mathcal{T}$ where $\Phi = \Phi_1 + \Phi_2$, $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathcal{S}^? = \mathcal{S}_1^? + \mathcal{S}_2^?$ and $\mathfrak{m} = [\mathsf{I0}] + \mathfrak{m}_1 + \mathfrak{m}_2$ and $t = \mathsf{if}(s, u, y.\, r)$. The judgment is derived from $\pi_1 \rhd \Phi_1; \Gamma_1, x : \mathcal{S}_1^? \vdash^{\mathfrak{m}_1} s : [\mathbb{0}]^{\mathsf{nat}}$ and $\pi_2 \rhd \Phi_2; \Gamma_2, x : \mathcal{S}_2^? \vdash^{\mathfrak{m}_2} u : \mathcal{T}$. We may assume $y \notin \{x\} \cup \mathsf{fv}(\mathbf{v})$ by α-conversion. By Lemma 19, there exist family contexts Ψ_1, Ψ_2, typing contexts Δ_1, Δ_2, multi-counters $\mathfrak{n}_1$, $\mathfrak{n}_2$ and multitypes $\mathcal{S}_1$, $\mathcal{S}_2$ such that $\Psi = \Psi_1 + \Psi_2$ and $\Delta = \Delta_1 + \Delta_2$ and $\mathfrak{n} = \mathfrak{n}_1 + \mathfrak{n}_2$ and for each $i = 1, 2$ we have $\zeta_i \rhd \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} \mathbf{v} : \mathcal{S}_i$ and $\mathcal{S}_i^? \lhd \mathcal{S}_i$. By IH on π_1 with ζ_1 and π_2 with ζ_2 we have $\pi_1' \rhd \Phi_1 + \Psi_1; \Gamma_1 + \Delta_1 \vdash^{\mathfrak{m}_1 + \mathfrak{n}_1} s\{x := \mathbf{v}\} : [\mathbb{0}]^{\mathsf{nat}}$ and $\pi_2' \rhd \Phi_2 + \Psi_2; \Gamma_2 + \Delta_2 \vdash^{\mathfrak{m}_1 + \mathfrak{n}_1} u\{x := \mathbf{v}\} : \mathcal{T}$. Applying rule $\mathsf{t\text{-}ifZero}$ we conclude with $\pi' \rhd \Phi + \Psi; \Gamma + \Delta \vdash^{\mathfrak{m}+\mathfrak{n}} \mathsf{if}(s\{x := \mathbf{v}\}, u\{x := \mathbf{v}\}, y.\, r\{x := \mathbf{v}\}) : \mathcal{T}$, and we are done since $\mathsf{if}(s\{x := \mathbf{v}\}, u\{x := \mathbf{v}\}, y.\, r\{x := \mathbf{v}\}) = (\mathsf{if}(s, u, y.\, r))\{x := \mathbf{v}\}$

8. $\mathsf{t\text{-}ifSucc}$. Then $\pi \rhd \Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2, x : \mathcal{S}_1^? + \mathcal{S}_2^? \vdash^{[\mathsf{IS}]+\mathfrak{m}_1+\mathfrak{m}_2} \mathsf{if}(s, u, y.\, r) : \mathcal{T}$ where $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathcal{S}^? = \mathcal{S}_1^? + \mathcal{S}_2^?$ and $\mathfrak{m} = [\mathsf{IS}] + \mathfrak{m}_1 + \mathfrak{m}_2$ and $t = \mathsf{if}(s, u, y.\, r)$. The judgment is derived from $\pi_1 \rhd \Phi_1; \Gamma_1, x : \mathcal{S}_1^? \vdash^{\mathfrak{m}_1} s : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}}$ and $\pi_2 \rhd \Phi_2; \Gamma_2, x : \mathcal{S}_2^?, y : \mathcal{N}^? \vdash^{\mathfrak{m}_2} r : \mathcal{T}$ and (1) $\mathcal{N}^? \lhd \mathcal{N}$. We may assume $y \notin \{x\} \cup \mathsf{fv}(\mathbf{v})$ by α-conversion. By Lemma 19 there exist family contexts Ψ_1, Ψ_2, typing contexts Δ_1, Δ_2, multi-counters $\mathfrak{n}_1$, $\mathfrak{n}_2$ and multitypes $\mathcal{S}_1$, $\mathcal{S}_2$ such that $\Psi = \Psi_1 + \Psi_2$ and $\Delta = \Delta_1 + \Delta_2$ and $\mathfrak{n} = \mathfrak{n}_1 + \mathfrak{n}_2$ and such that for each $i = 1, 2$ we have $\zeta_i \rhd \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} \mathbf{v} : \mathcal{S}_i$ and $\mathcal{S}_i^? \lhd \mathcal{S}_i$. By IH on π_1 with ζ_1 and π_2 with ζ_2 we have $\pi_1' \rhd \Phi_1 + \Psi_1; \Gamma_1 + \Delta_1 \vdash^{\mathfrak{m}_1 + \mathfrak{n}_1} s\{x := \mathbf{v}\} : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}}$ and $\pi_2' \rhd \Phi_2 + \Psi_2; (\Gamma_2, y : \mathcal{N}^?) + \Delta_2 \vdash^{\mathfrak{m}_2 + \mathfrak{n}_2} r\{x := \mathbf{v}\} : \mathcal{T}$. By Lemma 5 and α-conversion we can write $(\Gamma_2, y : \mathcal{N}^?) + \Delta_2$ as $\Gamma_2 + \Delta_2, y : \mathcal{N}^?$. Applying rule $\mathsf{t\text{-}ifSucc}$ with π_1', π_2' and (1) as premises we conclude with $\pi' \rhd \Phi + \Psi; \Gamma + \Delta \vdash^{\mathfrak{m}+\mathfrak{n}} \mathsf{if}(s\{x := \mathbf{v}\}, u\{x := \mathbf{v}\}, y.\, r\{x := \mathbf{v}\}) : \mathcal{T}$.

9. $\mathsf{t\text{-}fix}$. Then $\pi \rhd \Phi_0 +_{i \in I} \Phi_i; \Gamma_0 +_{i \in I} \Gamma_i, x : \mathcal{S}_0^? +_{i \in I} \mathcal{S}_i^? \vdash^{[\mathsf{F}]+\mathfrak{m}_0 +_{i \in I} \mathfrak{m}_i} \mathsf{fix}\, y.\, s : \mathcal{T}$ where $\Phi = \Phi_0 +_{i \in I} \Phi_i$ and $\Gamma = \Gamma_0 +_{i \in I} \Gamma_i$ and $\mathcal{S}^? = \mathcal{S}_0^? +_{i \in I} \mathcal{S}_i^?$ and $\mathfrak{m} = [\mathsf{F}] + \mathfrak{m}_0 +_{i \in I} \mathfrak{m}_i$ and $t = \mathsf{fix}\, y.\, s$. The judgment is derived from $\pi_0 \rhd \Phi_0, y : \{\!\{\mathcal{U}_i\}\!\}_{i \in I}; \Gamma_0, x : \mathcal{S}_0^? \vdash^{\mathfrak{m}_0} s : \mathcal{T}$ and $\pi_i \rhd \Phi_i; \Gamma_i, x : \mathcal{S}_i^? \vdash^{\mathfrak{m}_i} \mathsf{fix}\, y.\, s : \mathcal{U}_i$ for each $i \in I$. We may assume $y \notin \{x\} \cup \mathsf{fv}(\mathbf{v})$ by α-conversion. By Lemma 8, there exist family contexts Ψ_0, $(\Psi_i)_{i \in I}$, typing contexts Δ_0, $(\Delta_i)_{i \in I}$, multi-counters $\mathfrak{n}_0$, $(\mathfrak{n}_i)_{i \in I}$ and multitypes $\mathcal{S}_0$, $(\mathcal{S}_i)_{i \in I}$ such that $\Psi = \Psi_0 +_{i \in I} \Psi_i$ and $\Delta = \Delta_0 +_{i \in I} \Delta_i$ and $\mathfrak{n} = \mathfrak{n}_0 +_{i \in I} \mathfrak{n}_i$ and such that $\zeta_i \rhd \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} \mathbf{v} : \mathcal{S}_i$ and

$\mathcal{S}_i^? \lhd \mathcal{S}_i$ for each $i \in \{0\} \cup I$. By IH on π_0 with ζ_0 and π_i with ζ_i for each $i \in I$, we have $\pi_0' \rhd (\Phi_0, y : \{\!\!\{\mathcal{U}_i\}\!\!\}_{i \in I}) + \Psi_0; \Gamma_0 + \Delta_0 \vdash^{\mathfrak{m}_0 + \mathfrak{n}_0} s\{x := \mathbf{v}\} : \mathcal{T}$ and $\pi_i' \rhd \Phi_i + \Psi_i; \Gamma_i + \Delta_i \vdash^{\mathfrak{m}_i + \mathfrak{n}_i} \mathsf{fix}\, y.\, s\{x := \mathbf{v}\} : \mathcal{U}_i$ for each $i \in I$. By Lemma 5 and α-conversion we can write $(\Phi_0, y : \{\!\!\{\mathcal{U}_i\}\!\!\}_{i \in I}) + \Psi_0$ as $\Phi_0 + \Psi_0, y : \{\!\!\{\mathcal{U}_i\}\!\!\}_{i \in I}$. Applying rule $\mathtt{t\text{-}fix}$ with π_0' and $(\pi_i')_{i \in I}$ as premises, we conclude with $\pi' \rhd \Phi + \Psi; \Gamma + \Delta \vdash^{\mathfrak{m}+\mathfrak{n}} \mathsf{fix}\, y.\, s\{x := \mathbf{v}\} : \mathcal{T}$, and we are done since $\mathsf{fix}\, y.\, s\{x := \mathbf{v}\} = (\mathsf{fix}\, y.\, s)\{x := \mathbf{v}\}$

$\square$

Lemma 10 (Substitution Lemma). *Let I be a finite set, and $(\zeta_i \rhd \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} q : \mathcal{S}_i)_{i \in I}$ a family of type derivations. If $\pi \rhd \Phi, x : \{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I}; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$ then there exists a derivation π' such that $\pi' \rhd \Phi +_{i \in I} \Psi_i; \Gamma +_{i \in I} \Delta_i \vdash^{\mathfrak{m} +_{i \in I} \mathfrak{n}_i} t\{x := q\} : \mathcal{T}$.*

Proof. We proceed by induction on π.

1. $\mathtt{t\text{-}var_1}$. Then $\pi \rhd \varnothing; y : \mathcal{T} \vdash^{[\,]} y : \mathcal{T}$, where $\Phi, x : \{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I} = \varnothing$ and $\Gamma = y : \mathcal{T}$ and $\mathfrak{m} = [\,]$ and $t = y$. By the invariant we have $x \neq y$, hence $I = \varnothing$. We conclude by letting $\pi' := \pi$.

2. $\mathtt{t\text{-}var_2}$. Then $\pi \rhd y : \{\!\!\{\mathcal{T}\}\!\!\}; \varnothing \vdash^{[\,]} y : \mathcal{T}$, where $(\Phi, x : \{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I}) = y : \{\!\!\{\mathcal{T}\}\!\!\}$ and $\Gamma = \varnothing$, $\mathfrak{m} = [\,]$ and $t = y$. We consider two subcases, depending on whether $x = y$ or not:

   2.1 If $x = y$, then $\Phi = \varnothing$ and $\{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I} = \{\!\!\{\mathcal{T}\}\!\!\}$, *i.e.* I is a singleton, so we have only one judgment of the form $\Psi; \Delta \vdash^{\mathfrak{n}} q : \mathcal{S}$ and $\mathcal{S} = \mathcal{T}$. We conclude by letting $\pi' := \zeta$.

   2.2 If $x \neq y$, then $\Phi = y : \{\!\!\{\mathcal{T}\}\!\!\}$ and $\{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I} = \{\!\!\{\,\}\!\!\}$, that is, $I = \varnothing$. We conclude by letting $\pi' := \pi$.

3. $\mathtt{t\text{-}abs}$. Then $\pi \rhd +_{j \in J} \Phi_j, x : +_{j \in J} \{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I_j}; +_{j \in J} \Gamma_j \vdash^{+_{j \in J} \mathfrak{m}_j} \lambda y.\, s : [\mathcal{U}_j^? \to \mathcal{R}_j]_{j \in J}^{\mathsf{abs}}$, where $\Phi = +_{j \in J} \Phi_j$ and $\Gamma = +_{j \in J} \Gamma_j$ and $\mathfrak{m} = +_{j \in J} \mathfrak{m}_j$ and $t = \lambda y.\, s$ and $\mathcal{T} = [\mathcal{U}_j^? \to \mathcal{R}_j]_{j \in J}^{\mathsf{abs}}$ and we can write I as $\uplus_{j \in J} (I_j)_{j \in J}$ so that $\{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I} = +_{j \in J} \{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I_j}$. The judgment is derived from premises of the form $\pi_j \rhd \Phi_j, x : \{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I_j}; \Gamma_j, y : \mathcal{U}_j^? \vdash^{\mathfrak{m}_j} s : \mathcal{R}_j$ for each $j \in J$. Then for all $j \in J$ we can apply the IH on π_j with ζ_i for all $i \in I_j$, yielding $(\pi_j' \rhd \Phi_j +_{i \in I_j} \Psi_i; (\Gamma_j, y : \mathcal{U}_j^?) +_{i \in I_j} \Delta_i \vdash^{\mathfrak{m}_j +_{i \in I_j} \mathfrak{n}_i} s\{x := q\} : \mathcal{R}_j)_{j \in J}$. By Lemma 5 and α-conversion we can write $(\Gamma_j, y : \mathcal{U}_j^?) +_{i \in I_j} \Delta_i$ as $\Gamma_j +_{i \in I_j} \Delta_i, y : \mathcal{U}_j^?$. We conclude $\pi' \rhd \Phi +_{i \in I} \Psi_i; \Gamma +_{i \in I} \Delta_i \vdash^{\mathfrak{m} +_{i \in I} \mathfrak{n}_i} \lambda y.\, s\{x := q\} : [\mathcal{U}_j^? \to \mathcal{R}_j]_{j \in J}^{\mathsf{abs}}$ by applying rule $\mathtt{t\text{-}abs}$ to $(\pi_j')_{j \in J}$, and we are done since $\lambda y.\, s\{x := \mathbf{v}\} = (\lambda y.\, s)\{x := \mathbf{v}\}$.

4. $\mathtt{t\text{-}app}$. Then $\pi \rhd \Phi_1 + \Phi_2, x : \{\!\!\{\mathcal{S}_j\}\!\!\}_{j \in J} + \{\!\!\{\mathcal{S}_k\}\!\!\}_{k \in K}; \Gamma_1 + \Gamma_2 \vdash^{[\mathsf{B}] + \mathfrak{m}_1 + \mathfrak{m}_2} s\, u : \mathcal{T}$, where $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = [\mathsf{B}] + \mathfrak{m}_1 + \mathfrak{m}_2$ and $t = s\, u$, and we can write I as $J \uplus K$ so that $\{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I} = \{\!\!\{\mathcal{S}_j\}\!\!\}_{j \in J} + \{\!\!\{\mathcal{S}_k\}\!\!\}_{k \in K}$. The judgment is derived from $\pi_1 \rhd \Phi_1, x : \{\!\!\{\mathcal{S}_j\}\!\!\}_{j \in J}; \Gamma_1 \vdash^{\mathfrak{m}_1} s : [\mathcal{U}^? \to \mathcal{T}]^{\mathsf{abs}}$ and $\pi_2 \rhd \Phi_2, x : \{\!\!\{\mathcal{S}_k\}\!\!\}_{k \in K}; \Gamma_2 \vdash^{\mathfrak{m}_2} u : \mathcal{U}$, where (1) $\mathcal{U}^? \lhd \mathcal{U}$. We can apply IH on π_1 and $(\zeta_j)_{j \in J}$, yielding $\pi_1' \rhd \Phi_1 +_{j \in J} \Psi_j; \Gamma_1 +_{j \in J} \Delta_j \vdash^{\mathfrak{m}_1 +_{j \in J} \mathfrak{n}_j} s\{x := q\} : [\mathcal{U}^? \to \mathcal{T}]^{\mathsf{abs}}$. On the other hand, we can apply IH on π_2 and $(\zeta_k)_{k \in K}$, yielding $\pi_2' \rhd \Phi_2 +_{k \in K} \Psi_k; \Gamma_2 +_{k \in K} \Delta_k \vdash^{\mathfrak{m}_2 +_{k \in K} \mathfrak{n}_k} u\{x := q\} : \mathcal{U}$. Applying rule $\mathtt{t\text{-}app}$ with π_1', π_2', and (1) as premises we conclude with $\pi' \rhd \Phi +_{i \in I} \Psi_i; \Gamma +_{i \in I} \Delta_i \vdash^{\mathfrak{m} +_{i \in I} \mathfrak{n}_i} s\{x := q\}\, u\{x := q\} : \mathcal{T}$, and we are done since $s\{x := q\}\, u\{x := q\} = (s\, u)\{x := q\}$.

5. $\mathtt{t\text{-}zero}$. Then $\pi \rhd \varnothing; \varnothing \vdash^{[\,]} \mathbf{0} : [\mathbb{0}]_{j \in J}^{\mathsf{nat}}$, where $\Phi, x : \{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I} = \varnothing$ and $\Gamma = \varnothing$ and $\mathfrak{m} = [\,]$ and $t = \mathbf{0}$ and $\mathcal{T} = [\mathbb{0}]_{j \in J}^{\mathsf{nat}}$. Hence $\{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I} = \{\!\!\{\,\}\!\!\}$, then $I = \varnothing$. We conclude by letting $\pi' := \pi$, since $\mathbf{0}\{x := q\} = \mathbf{0}$.

6. **t-succ.** Then $\pi \triangleright \Phi, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I}; \Gamma \vdash^{\mathfrak{m}} \mathbf{S}(u) : [\mathbb{S}(\mathcal{N}_j)]^{\mathsf{nat}}_{j \in J}$, where $t = \mathbf{S}(u)$ and $\mathcal{T} = [\mathbb{S}(\mathcal{N}_j)]^{\mathsf{nat}}_{j \in J}$. The judgment is derived from $\pi_0 \triangleright \Phi, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I}; \Gamma \vdash^{\mathfrak{m}} u : +_{j \in J} \mathcal{N}_j$. We can apply IH on π_0 with $(\zeta_i)_{i \in I}$, yielding $\pi_0' \triangleright \Phi +_{i \in I} \Psi_i; \Gamma +_{i \in I} \Delta_i \vdash^{\mathfrak{m} +_{i \in I} \mathfrak{n}_i} u\{x := q\} : +_{j \in J} \mathcal{N}_j$. Applying rule **t-succ**, we conclude with $\pi' \triangleright \Phi +_{i \in I} \Psi_i; \Gamma +_{i \in I} \Delta_i \vdash^{\mathfrak{m} +_{i \in I} \mathfrak{n}_i} \mathbf{S}(u\{x := q\}) : [\mathbb{S}(\mathcal{N}_j)]^{\mathsf{nat}}_{j \in J}$, and we are done since $\mathbf{S}(u\{x := q\}) = (\mathbf{S}(u))\{x := q\}$.

7. **t-ifZero.** Then $\pi \triangleright \Phi_1 + \Phi_2, x : \{\!\{\mathcal{S}_j\}\!\}_{j \in J} + \{\!\{\mathcal{S}_j\}\!\}_{k \in K}; \Gamma_1 + \Gamma_2 \vdash^{[\mathtt{I0}] + \mathfrak{m}_1 + \mathfrak{m}_2} \mathsf{if}(s, u, y. r) : \mathcal{T}$ where $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = [\mathtt{I0}] + \mathfrak{m}_1 + \mathfrak{m}_2$ and $t = \mathsf{if}(s, u, y. r)$, and $I = J \uplus K$ so that $\{\!\{\mathcal{S}_i\}\!\}_{i \in I} = \{\!\{\mathcal{S}_j\}\!\}_{j \in J} + \{\!\{\mathcal{S}_k\}\!\}_{k \in K}$. The judgment is derived from $\pi_1 \triangleright \Phi_1, x : \{\!\{\mathcal{S}_j\}\!\}_{j \in J}; \Gamma_1 \vdash^{\mathfrak{m}_1} s : [\mathbb{0}]^{\mathsf{nat}}$ and $\pi_2 \triangleright \Phi_2, x : \{\!\{\mathcal{S}_k\}\!\}_{k \in K}; \Gamma_2 \vdash^{\mathfrak{m}_2} u : \mathcal{T}$. By α-conversion we may assume $y \notin \{x\} \cup \mathsf{fv}(q)$. By IH on both π_1 with $(\zeta_j)_{j \in J}$ and π_2 with $(\pi_k)_{k \in K}$ we have $\pi_1' \triangleright \Phi_1 +_{j \in J} \Psi_j; \Gamma_1 +_{j \in J} \Delta_j \vdash^{\mathfrak{m}_1 +_{j \in J} \mathfrak{n}_j} s\{x := q\} : [\mathbb{0}]^{\mathsf{nat}}$ and $\pi_2' \triangleright \Phi_2 +_{k \in K} \Psi_k; \Gamma_2 +_{k \in K} \Delta_k \vdash^{\mathfrak{m}_2 +_{k \in K} \mathfrak{n}_k} u\{x := q\} : \mathcal{T}$. Applying rule **t-ifZero**, we conclude with $\pi' \triangleright \Phi +_{i \in I} \Psi; \Gamma +_{i \in I} \Delta_i \vdash^{\mathfrak{m} +_{i \in I} \mathfrak{n}_i} \mathsf{if}(s\{x := q\}, u\{x := q\}, y. r\{x := q\}) : \mathcal{T}$, and we are done since $\mathsf{if}(s\{x := q\}, u\{x := q\}, y. r\{x := q\}) = (\mathsf{if}(s, u, y. r))\{x := q\}$.

8. **t-ifSucc.** Then $\pi \triangleright \Phi_1 + \Phi_2 + x : \{\!\{\mathcal{S}_j\}\!\}_{j \in J} + \{\!\{\mathcal{S}_k\}\!\}_{k \in K}; \Gamma_1 + \Gamma_2 \vdash^{[\mathtt{IS}] + \mathfrak{m}_1 + \mathfrak{m}_2} \mathsf{if}(s, u, y. r) : \mathcal{T}$ where $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = [\mathtt{IS}] + \mathfrak{m}_1 + \mathfrak{m}_2$ and $t = \mathsf{if}(s, u, y. r)$, and $I = J \uplus K$, so that $\{\!\{\mathcal{S}_i\}\!\}_{i \in I} = \{\!\{\mathcal{S}_j\}\!\}_{j \in J} + \{\!\{\mathcal{S}_k\}\!\}_{k \in K}$. The judgment is derived from $\pi_1 \triangleright \Phi_1, x : \{\!\{\mathcal{S}_j\}\!\}_{j \in J}; \Gamma_1 \vdash^{\mathfrak{m}_1} s : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}}$ and $\pi_2 \triangleright \Phi_2, x : \{\!\{\mathcal{S}_k\}\!\}_{k \in K}; \Gamma_2, y : \mathcal{N}^? \vdash^{\mathfrak{m}_2} r : \mathcal{T}$ and (1) $\mathcal{N}^? \lhd \mathcal{N}$. By α-conversion we may assume $y \notin \{x\} \cup \mathsf{fv}(q)$. Then by the IH on both π_1 with $(\zeta_j)_{j \in J}$ and π_2 with $(\zeta_k)_{k \in K}$ we have $\pi_1' \triangleright \Phi_1 +_{j \in J} \Psi_j; \Gamma_1 +_{j \in J} \Delta_j \vdash^{\mathfrak{m}_1 +_{j \in J} \mathfrak{n}_j} s\{x := q\} : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}}$ and $\pi_2' \triangleright \Phi_2 +_{k \in K} \Psi_k; (\Gamma_2, y : \mathcal{N}^?) +_{k \in K} \Delta_k \vdash^{\mathfrak{m}_2 +_{k \in K} \mathfrak{n}_k} r\{x := q\} : \mathcal{T}$. By Lemma 5 and α-conversion we can write $(\Gamma_2, y : \mathcal{N}^?) +_{k \in K} \Delta_k$ as $\Gamma_2 +_{k \in K} \Delta_k, y : \mathcal{N}^?$. Applying rule **t-ifSucc** with π_1', π_2' and (1) as premises we conclude with $\pi' \triangleright \Phi +_{i \in I} \Psi_i; \Gamma +_{i \in I} \Delta_i \vdash^{\mathfrak{m} +_{i \in I} \mathfrak{n}_i} \mathsf{if}(s\{x := q\}, u\{x := q\}, y. r\{x := q\}) : \mathcal{T}$.

9. **t-fix.** Then $\pi \triangleright \Phi_0 +_{j \in J} \Phi_j, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I_0} +_{j \in J} \{\!\{\mathcal{S}_i\}\!\}_{i \in I_j}; \Gamma_0 +_{j \in J} \Gamma_j \vdash^{[\mathtt{F}] + \mathfrak{m}_0 +_{j \in J} \mathfrak{m}_j} \mathsf{fix}\, y. s : \mathcal{T}$ where $\Phi = \Phi_0 +_{j \in J} \Phi_j$ and $\Gamma = \Gamma_0 +_{j \in J} \Gamma_j$ and $\mathfrak{m} = [\mathtt{F}] + \mathfrak{m}_0 +_{j \in J} \mathfrak{m}_j$ and $t = \mathsf{fix}\, y. s$, and we can write $I = I_0 \uplus_{j \in J} I_j$, so that $\{\!\{\mathcal{S}_i\}\!\}_{i \in I} = \{\!\{\mathcal{S}_i\}\!\}_{i \in I_0} +_{j \in J} \{\!\{\mathcal{S}_i\}\!\}_{i \in I_j}$. The judgment is derived from $\pi_0 \triangleright \Phi_0, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I_0}, y : \{\!\{\mathcal{U}_j\}\!\}_{j \in J}; \Gamma_0 \vdash^{\mathfrak{m}_0} s : \mathcal{T}$ and $\pi_j \triangleright \Phi_j, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I_j}; \Gamma_j \vdash^{\mathfrak{m}_j} \mathsf{fix}\, y. s : \mathcal{U}_j$ for each $j \in J$. By α-conversion we may assume $y \notin \{x\} \cup \mathsf{fv}(q)$. Then by the IH on π_0 with $(\zeta_i)_{i \in I_0}$ and $(\pi_j)_{j \in J}$ with $(\zeta_i)_{i \in I_j}$ we have $\pi_0' \triangleright (\Phi_0, y : \{\!\{\mathcal{U}_j\}\!\}_{j \in J}) +_{i \in I_0} \Psi_i; \Gamma_0 +_{i \in I_0} \Delta_i \vdash^{\mathfrak{m}_0 +_{i \in I_0} \mathfrak{n}_i} s\{x := q\} : \mathcal{T}$ and $\pi_j' \triangleright \Phi_j +_{i \in I_j} \Psi_i; \Gamma_j +_{i \in I_j} \Delta_i \vdash^{\mathfrak{m}_j +_{i \in I_j} \mathfrak{n}_i} (\mathsf{fix}\, y. s)\{x := q\} : \mathcal{U}_j$ for each $j \in J$, with $(\mathsf{fix}\, y. s)\{x := q\} = \mathsf{fix}\, y. s\{x := q\}$. By Lemma 5 and α-conversion we can write $(\Phi_0, y : \{\!\{\mathcal{U}_j\}\!\}_{j \in J}) +_{i \in I_0} \Psi_i$ as $\Phi_0 +_{i \in I_0} \Psi_i, y : \{\!\{\mathcal{U}_j\}\!\}_{j \in J}$. Applying rule **t-fix** we conclude with $\pi' \triangleright \Phi +_{i \in I} \Psi_i; \Gamma +_{i \in I} \Delta_i \vdash^{\mathfrak{m} +_{i \in I} \mathfrak{n}_i} \mathsf{fix}\, y. s\{x := q\} : \mathcal{T}$.

$\square$

Lemma 11 (Subject Reduction). *Let t be such that $t \to_\rho t'$ and $\pi \triangleright \Phi; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$. Then there exist a derivation π' and a multi-counter $\mathfrak{m}'$ such that $[\rho] + \mathfrak{m}' = \mathfrak{m}$ and $\pi' \triangleright \Phi; \Gamma \vdash^{\mathfrak{m}'} t' : \mathcal{T}$.*

Proof. By induction on the derivation of $t \to_\rho t'$.

- **r-beta.** Then $t = (\lambda x. s)\, \mathbf{v} \to_{\mathtt{B}} s\{x := \mathbf{v}\} = t'$. The conclusion of π can then only be derived using rule **t-app**, so π has the form:

$$\dfrac{\dfrac{\pi_1 \triangleright \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}_1} s : \mathcal{T}}{\Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1} \lambda x. s : [\mathcal{S}^? \to \mathcal{T}]^{\mathsf{abs}}} \, \mathtt{t\text{-}abs} \quad (1)\, \mathcal{S}^? \lhd \mathcal{S} \quad \pi_2 \triangleright \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} \mathbf{v} : \mathcal{S}}{\Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{[\mathtt{B}] + \mathfrak{m}_1 + \mathfrak{m}_2} (\lambda x. s)\, \mathbf{v} : \mathcal{T}} \, \mathtt{t\text{-}app}$$

where $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = [\mathtt{B}] + \mathfrak{m}_1 + \mathfrak{m}_2$. Given (1), we can apply Lemma 9 to π_1 with π_2, yielding $\pi' \rhd \Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{\mathfrak{m}_1 + \mathfrak{m}_2} s\{x := \mathbf{v}\} : \mathcal{T}$, and we conclude with $\mathfrak{m}' = \mathfrak{m}_1 + \mathfrak{m}_2$, since $[\mathtt{B}] + \mathfrak{m}' = [\mathtt{B}] + \mathfrak{m}_1 + \mathfrak{m}_2 = \mathfrak{m}$.

- r-if0. Then $t = \mathsf{if}(\mathbf{0}, s, x.\, u) \to_{\mathtt{I0}} s = t'$. The conclusion of π can then only be derived using rule t-ifZero, so π has the form:

$$
\cfrac{
\cfrac{}{\varnothing; \varnothing \vdash^{[\,]} \mathbf{0} : [\mathbb{0}]^{\mathsf{nat}}} \text{ t-zero} \quad \pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}'} s : \mathcal{T}
}{
\Phi; \Gamma \vdash^{[\mathtt{I0}] + \mathfrak{m}'} \mathsf{if}(\mathbf{0}, s, x.\, u) : \mathcal{T}
} \text{ t-ifZero}
$$

where $\mathfrak{m} = [\mathtt{I0}] + \mathfrak{m}'$. It suffices to note that π' is the needed derivation, so we are done.

- r-ifS. Then $t = \mathsf{if}(\mathbf{S}(\mathbf{k}), s, x.\, u) \to_{\mathtt{IS}} u\{x := \mathbf{k}\} = t'$. The conclusion of π can then only be derived using rule t-ifSucc, so π has the form:

$$
\cfrac{
\cfrac{\pi_1 \rhd \Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1} \mathbf{k} : \mathcal{N}}{\Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1} \mathbf{S}(\mathbf{k}) : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}}} \text{ t-succ} \quad \mathcal{N}^? \lhd \mathcal{N} \quad \pi_2 \rhd \Phi_2; \Gamma_2, x : \mathcal{N}^? \vdash^{\mathfrak{m}_2} u : \mathcal{T}
}{
\Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{[\mathtt{IS}] + \mathfrak{m}_1 + \mathfrak{m}_2} \mathsf{if}(\mathbf{S}(\mathbf{k}), s, x.\, u) : \mathcal{T}
} \text{ t-ifSucc}
$$

where $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = [\mathtt{IS}] + \mathfrak{m}_1 + \mathfrak{m}_2$. Applying Lemma 9 on π_2 with π_1 leads us to $\pi' \rhd \Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{\mathfrak{m}_1 + \mathfrak{m}_2} u\{x := \mathbf{k}\} : \mathcal{T}$, where $\mathfrak{m}' = \mathfrak{m}_1 + \mathfrak{m}_2$ and we conclude since $[\mathtt{IS}] + \mathfrak{m}' = \mathfrak{m}$.

- t-fix. Then $t = \mathsf{fix}\, x.\, s \to_\rho s\{x := \mathsf{fix}\, x.\, s\} = t'$. The conclusion of π can then only be derived by rule t-fix, so π has the form:

$$
\cfrac{
\pi_0 \rhd \Phi_0, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I}; \Gamma_0 \vdash^{\mathfrak{m}_0} s : \mathcal{T} \quad (\pi_i \rhd \Phi_i; \Gamma_i \vdash^{\mathfrak{m}_i} \mathsf{fix}\, x.\, s : \mathcal{S}_i)_{i \in I}
}{
\Phi_0 +_{i \in I} \Phi_i; \Gamma_0 +_{i \in I} \Gamma_i \vdash^{[\mathtt{F}] + \mathfrak{m}_0 +_{i \in I} \mathfrak{m}_i} \mathsf{fix}\, x.\, s : \mathcal{T}
} \text{ t-fix}
$$

where $\Phi = \Phi_0 +_{i \in I} \Phi_i$ and $\Gamma = \Gamma_0 +_{i \in I} \Gamma_i$ and $\mathfrak{m} = \mathfrak{m}_0 +_{i \in I} \mathfrak{m}_i$. By Lemma 10 on π_0 with $(\pi_i)_{i \in I}$ we obtain $\pi' \rhd \Phi_0 +_{i \in I} \Phi_i; \Gamma_0 +_{i \in I} \Gamma_i \vdash^{\mathfrak{m}_0 +_{i \in I} \mathfrak{m}_i} s\{x := \mathsf{fix}\, x.\, s\} : \mathcal{T}$. We let $\mathfrak{m}' = \mathfrak{m}_0 +_{i \in I} \mathfrak{m}_i$ and we conclude since $[\mathtt{F}] + \mathfrak{m}' = [\mathtt{F}] + \mathfrak{m}_0 +_{i \in I} \mathfrak{m}_i = \mathfrak{m}$.

- r-appL. Then $t = s\, u \to_\rho s'\, u = t'$, derived from $s \to_\rho s'$. The conclusion of π can then only be derived by rule t-app, so π has the form:

$$
\cfrac{
\pi_1 \rhd \Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1} s : [\mathcal{S}^? \to \mathcal{T}]^{\mathsf{abs}} \quad (1)\, \mathcal{S}^? \lhd \mathcal{S} \quad \pi_2 \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} u : \mathcal{S}
}{
\Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{[\mathtt{B}] + \mathfrak{m}_1 + \mathfrak{m}_2} s\, u : \mathcal{T}
} \text{ t-app}
$$

where $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = [\mathtt{B}] + \mathfrak{m}_1 + \mathfrak{m}_2$. By the IH on $s \to_\rho s'$ and using π_1, there exists $\mathfrak{m}_1'$ such that $\mathfrak{m}_1 = [\rho] + \mathfrak{m}_1'$ and $\pi_1' \rhd \Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1'} s' : [\mathcal{S}^? \to \mathcal{T}]^{\mathsf{abs}}$. Applying rule t-app with π_1', (1) and π_2 as premises, we conclude with $\pi' \rhd \Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{[\mathtt{B}] + \mathfrak{m}_1' + \mathfrak{m}_2} s'\, u : \mathcal{T}$. We let $\mathfrak{m}' = [\mathtt{B}] + \mathfrak{m}_1' + \mathfrak{m}_2$, thus $[\rho] + \mathfrak{m}' = [\mathtt{B}] + \mathfrak{m}_1' + \mathfrak{m}_2 = [\mathtt{B}] + \mathfrak{m}_1 + \mathfrak{m}_2 = \mathfrak{m}$.

- r-appR. Analogous to the previous case.

- r-succ. Then $t = \mathbf{S}(s) \to_\rho \mathbf{S}(s') = t'$, derived from $s \to_\rho s'$. The conclusion of π can then only be derived by rule t-succ, so π has the form:

$$
\cfrac{
\pi_0 \rhd \Phi; \Gamma \vdash^{\mathfrak{m}} s : +_{i \in I} \mathcal{M}_i
}{
\Phi; \Gamma \vdash^{\mathfrak{m}} \mathbf{S}(s) : [\mathbb{S}(\mathcal{M}_i)]^{\mathsf{nat}}_{i \in I}
} \text{ t-succ}
$$

where $\mathcal{T} = [\mathbb{S}(\mathcal{M}_i)]_{i \in I}^{\mathsf{nat}}$. By the IH on $s \to_\rho s'$ and using π_0, there exists $\mathfrak{m}'$ such that $\mathfrak{m} = [\rho] + \mathfrak{m}'$ and $\pi_0' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}'} s' : +_{i \in I} \mathcal{M}_i$. Applying rule $\mathtt{t\text{-}succ}$ with π_0' as premise, we conclude with $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}'} \mathbf{S}(s') : [\mathbb{S}(\mathcal{M}_i)]_{i \in I}^{\mathsf{nat}}$, where $\mathfrak{m} = [\rho] + \mathfrak{m}'$.

- $\mathtt{r\text{-}if}$. Then $t = \mathsf{if}(s, u, x.\, r) \to_\rho \mathsf{if}(s', u, x.\, r) = t'$, derived from $s \to_\rho s'$. The conclusion of π can be derived either by rule $\mathtt{t\text{-}ifZero}$ or by rule $\mathtt{t\text{-}ifSucc}$. Let us suppose the first case, as the second one is analogous. Then π is of the form:

$$\frac{\pi_1 \rhd \Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1} s : [\mathbb{0}]^{\mathsf{nat}} \qquad \pi_2 \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} u : \mathcal{T}}{\Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{[\mathtt{I0}] + \mathfrak{m}_1 + \mathfrak{m}_2} \mathsf{if}(s, u, x.\, r) : \mathcal{T}} \; \mathtt{t\text{-}ifZero}$$

where $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = [\mathtt{I0}] + \mathfrak{m}_1 + \mathfrak{m}_2$. By the IH on $s \to_\rho s'$ and using π_1, there exists $\mathfrak{m}_1'$ such that $\mathfrak{m}_1 = [\rho] + \mathfrak{m}_1'$ and $\pi_1' \rhd \Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1'} s' : [\mathbb{0}]^{\mathsf{nat}}$. Applying rule $\mathtt{t\text{-}ifZero}$ with π_1' and π_2 as premises, we conclude with $\pi' \rhd \Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{[\mathtt{I0}] + \mathfrak{m}_1' + \mathfrak{m}_2} \mathsf{if}(s', u, x.\, r) : \mathcal{T}$. We let $\mathfrak{m}' = [\mathtt{I0}] + \mathfrak{m}_1' + \mathfrak{m}_2$, thus $[\rho] + \mathfrak{m}' = [\rho] + [\mathtt{I0}] + \mathfrak{m}_1' + \mathfrak{m}_2 = [\mathtt{I0}] + \mathfrak{m}_1 + \mathfrak{m}_2 = \mathfrak{m}$.

$\square$

Lemma 12 (Value Anti-Substitution). *Let $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}} t\{x := \mathbf{v}\} : \mathcal{T}$. Then there exist family contexts Φ_1, Φ_2, typing contexts Γ_1, Γ_2, multi-counters $\mathfrak{m}_1$, $\mathfrak{m}_2$, an optional multitype $\mathcal{S}^?$ and a multitype $\mathcal{S}$ satisfying:*

1. $\pi \rhd \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}_1} t : \mathcal{T}$

2. $\zeta \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} \mathbf{v} : \mathcal{S}$

3. $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = \mathfrak{m}_1 + \mathfrak{m}_2$ and $\mathcal{S}^? \lhd \mathcal{S}$

Proof. We first consider the case $t = x$, for which we have $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}} \mathbf{v} : \mathcal{T}$ as hypothesis. Then taking $\Phi_1 := \varnothing$ and $\Phi_2 := \Phi$ and $\Gamma_1 := \varnothing$ and $\Gamma_2 := \Gamma$ and $\mathfrak{m}_1 := [\,]$ and $\mathfrak{m}_2 := \mathfrak{m}$ and $\mathcal{S}^? := \mathcal{T}$ and $\mathcal{S} := \mathcal{T}$, we conclude that the following hold:

1. $\pi \rhd \varnothing; x : \mathcal{T} \vdash^{[\,]} x : \mathcal{T}$, by rule $\mathtt{t\text{-}var}_1$

2. $\zeta \rhd \Phi; \Gamma \vdash^{\mathfrak{m}} \mathbf{v} : \mathcal{T}$, by letting $\zeta := \pi'$

3. $\Phi = \varnothing + \Phi = \Phi_1 + \Phi_2$ and $\Gamma = \varnothing + \Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = [\,] + \mathfrak{m} = \mathfrak{m}_1 + \mathfrak{m}_2$ and $\mathcal{T} \lhd \mathcal{T}$

If $t \neq x$, then we proceed by induction on π'.

- $\mathtt{t\text{-}var}_1$. Then $t = y$, with $y \neq x$, and $\pi' \rhd \varnothing; y : \mathcal{T} \vdash^{[\,]} y : \mathcal{T}$, where $\Phi = \varnothing$ and $\Gamma = y : \mathcal{T}$ and $\mathfrak{m} = [\,]$. Taking $\Phi_1 = \Phi_2 := \varnothing$ and $\Gamma_1 := y : \mathcal{T}$ and $\Gamma_2 := \varnothing$ and $\mathfrak{m}_1 = \mathfrak{m}_2 := [\,]$ and $\mathcal{S}^? := \bot$ and $\mathcal{S} := [\,]^\nu$ with ν a proper nature, we conclude with:

  1. $\pi \rhd \varnothing; y : \mathcal{T}, x : \bot \vdash^{[\,]} y : \mathcal{T}$, by letting $\pi := \pi'$
  2. $\zeta \rhd \varnothing; \varnothing \vdash^{[\,]} \mathbf{v} : [\,]^\nu$, by Lemma 6
  3. $\Phi = \varnothing = \varnothing + \varnothing = \Phi_1 + \Phi_2$ and $\Gamma = (y : \mathcal{T}) + \varnothing = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = [\,] = [\,] + [\,] = \mathfrak{m}_1 + \mathfrak{m}_2$ and $\bot \lhd [\,]^\nu$.

- $\mathtt{t\text{-}var}_2$. Analogous to the previous case.

- t-abs. Then $\pi' \rhd +_{i \in I} \Phi_i; +_{i \in I} \Gamma_i \vdash^{+_{i \in I} \mathfrak{m}_i} \lambda y. s : [\mathcal{U}_i^? \to \mathcal{R}_i]_{i \in I}^{\mathsf{abs}}$, with $\Phi = +_{i \in I} \Phi_i$ and $\Gamma = +_{i \in I} \Gamma_i$ and $\mathfrak{m} = +_{i \in I} \mathfrak{m}_i$ and $\mathcal{T} = [\mathcal{U}_i^? \to \mathcal{R}_i]_{i \in I}^{\mathsf{abs}}$. Then $t = \lambda y. s'$, with $s = s'\{x := \mathbf{v}\}$. The judgment is derived from premises of the form $\pi_i' \rhd \Phi_i; \Gamma_i, y : \mathcal{U}_i^? \vdash^{\mathfrak{m}_i} s : \mathcal{R}_i$ for each $i \in I$. We can apply the IH on $(\pi_i)_{i \in I}$, yielding that for each $i \in I$ there exist family contexts Φ_{i1}, Φ_{i2}, typing contexts Γ_{i1}, Γ_{i2}, multi-counters $\mathfrak{m}_{i1}, \mathfrak{m}_{i2}$, an optional multitype $\mathcal{S}_i^?$ and a multitype $\mathcal{S}_i$ such that:

  i.1. $\left(\pi_i \rhd \Phi_{i1}; \Gamma_{i1}, y : \mathcal{U}_i^?, x : \mathcal{S}_i^? \vdash^{\mathfrak{m}_{i1}} s' : \mathcal{R}_i\right)_{i \in I}$

  i.2. $\left(\zeta_i \rhd \Phi_{i2}; \Gamma_{i2} \vdash^{\mathfrak{m}_{i2}} \mathbf{v} : \mathcal{S}_i\right)_{i \in I}$

  i.3. $\Phi_i = \Phi_{i1} + \Phi_{i2}$ and $\Gamma_i, y : \mathcal{U}_i^? = (\Gamma_{i1}, y : \mathcal{U}_i^?) + \Gamma_{i2}$ and $\mathfrak{m}_i = \mathfrak{m}_{i1} + \mathfrak{m}_{i2}$ and $\mathcal{S}_i^? \lhd \mathcal{S}_i$.

  For each $i \in I$, it is not necessary to split $y : \mathcal{U}_i^?$, as we may assume $y \notin \mathsf{fv}(\mathbf{v})$ by α-conversion, so $x \notin \mathsf{dom}(\Gamma_{i2})$ by Lemma 5. Taking $\Phi_1 := +_{i \in I} \Phi_{i1}$ and $\Phi_2 := +_{i \in I} \Phi_{i2}$ and $\Gamma_1 := +_{i \in I} \Gamma_{i1}$ and $\Gamma_2 := +_{i \in I} \Gamma_{i2}$ and $\mathfrak{m}_1 := +_{i \in I} \mathfrak{m}_{i1}$ and $\mathfrak{m}_2 := +_{i \in I} \mathfrak{m}_{i2}$ and $\mathcal{S}^? := +_{i \in I} \mathcal{S}_i^?$ and $\mathcal{S} := +_{i \in I} \mathcal{S}_i$ we conclude with:

  1. $\pi \rhd +_{i \in I} \Phi_{i1}; +_{i \in I} \Gamma_{i1}, x : +_{i \in I} \mathcal{S}_i \vdash^{+_{i \in I} \mathfrak{m}_{i1}} \lambda y. s' : [\mathcal{U}_i^? \to \mathcal{R}_i]_{i \in I}^{\mathsf{abs}}$, by applying rule t-abs to $(\pi_i)_{i \in I}$

  2. $\zeta \rhd +_{i \in I} \Phi_{i2}; +_{i \in I} \Gamma_{i2} \vdash^{+_{i \in I} \mathfrak{m}_{i2}} \mathbf{v} : +_{i \in I} \mathcal{S}_i$, as the result of applying Lemma 8 to $(\zeta_i)_{i \in I}$

  3. $\Phi = +_{i \in I} \Phi_i = +_{i \in I} (\Phi_{i1} + \Phi_{i2}) = \Phi_1 + \Phi_2$ and $\Gamma = +_{i \in I} \Gamma_i = +_{i \in I} (\Gamma_{i1} + \Gamma_{i2}) = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = +_{i \in I} \mathfrak{m}_i = +_{i \in I} (\mathfrak{m}_{i1} + \mathfrak{m}_{i2}) = \mathfrak{m}_1 + \mathfrak{m}_2$ and $+_{i \in I} \mathcal{S}_i^? \lhd +_{i \in I} \mathcal{S}_i$ by Lemma 8

- t-app. Then $\pi' \rhd \Phi_a + \Phi_b; \Gamma_a + \Gamma_b \vdash^{[\mathsf{B}] + \mathfrak{m}_a + \mathfrak{m}_b} s\, u : \mathcal{T}$, where $\Phi = \Phi_a + \Phi_b$ and $\Gamma = \Gamma_a + \Gamma_b$ and $\mathfrak{m} = [\mathsf{B}] + \mathfrak{m}_a + \mathfrak{m}_b$. Since $t \neq x$, then $t = s'\, u'$ with $s = s'\{x := \mathbf{v}\}$ and $u = u'\{x := \mathbf{v}\}$. The judgment is derived from $\pi_a' \rhd \Phi_a; \Gamma_a \vdash^{\mathfrak{m}_a} s : [\mathcal{U}^? \to \mathcal{T}]^{\mathsf{abs}}$ and $\pi_b' \rhd \Phi_b; \Gamma_b \vdash^{\mathfrak{m}_b} u : \mathcal{U}$, where $\mathcal{U}^? \lhd \mathcal{U}$. We can apply IH on π_a, yielding that there exist family contexts Φ_{a1}, Φ_{a2}, typing contexts Γ_{a1}, Γ_{a2}, multi-counters $\mathfrak{m}_{a1}, \mathfrak{m}_{a2}$, an optional multitype $\mathcal{S}_a^?$ and a multitype $\mathcal{S}_a$ satisfying:

  a.1. $\pi_a \rhd \Phi_{a1}; \Gamma_{a1}, x : \mathcal{S}_a^? \vdash^{\mathfrak{m}_{a1}} s' : [\mathcal{U}^? \to \mathcal{T}]^{\mathsf{abs}}$

  a.2. $\zeta_a \rhd \Phi_{a2}; \Gamma_{a2} \vdash^{\mathfrak{m}_{a2}} \mathbf{v} : \mathcal{S}_a$

  a.3. $\Phi_a = \Phi_{a1} + \Phi_{a2}$ and $\Gamma_a = \Gamma_{a1} + \Gamma_{a2}$ and $\mathfrak{m}_1 = \mathfrak{m}_{a1} + \mathfrak{m}_{a2}$ and $\mathcal{S}_a^? \lhd \mathcal{S}_a$

  On the other hand we can apply IH on π_b, yielding that there exist family contexts Φ_{b1}, Φ_{b2}, typing contexts Γ_{b1}, Γ_{b2}, multi-counters $\mathfrak{m}_{b1}, \mathfrak{m}_{b2}$, an optional multitype $\mathcal{S}_b^?$ and a multitype $\mathcal{S}_b$ satisfying:

  b.1. $\pi_b \rhd \Phi_{b1}; \Gamma_{b1}, x : \mathcal{S}_b^? \vdash^{\mathfrak{m}_{b1}} u' : \mathcal{U}$

  b.2. $\zeta_b \rhd \Phi_{b2}; \Gamma_{b2} \vdash^{\mathfrak{m}_{b2}} \mathbf{v} : \mathcal{S}_b$

  b.3. $\Phi_b = \Phi_{b1} + \Phi_{b2}$ and $\Gamma_b = \Gamma_{b1} + \Gamma_{b2}$ and $\mathfrak{m}_b = \mathfrak{m}_{b1} + \mathfrak{m}_{b2}$ and $\mathcal{S}_b^? \lhd \mathcal{S}_b$

  Then, taking $\Phi_1 := \Phi_{a1} + \Phi_{b1}$ and $\Phi_2 := \Phi_{a2} + \Phi_{b2}$ and $\Gamma_1 := \Gamma_{a1} + \Gamma_{b1}$ and $\Gamma_2 := \Gamma_{a2} + \Gamma_{b2}$ and $\mathfrak{m}_1 := [\mathsf{B}] + \mathfrak{m}_{a1} + \mathfrak{m}_{b1}$ and $\mathfrak{m}_2 := \mathfrak{m}_{a2} + \mathfrak{m}_{b2}$ and $\mathcal{S}^? := \mathcal{S}_a^? + \mathcal{S}_b^?$ and $\mathcal{S} := \mathcal{S}_a + \mathcal{S}_b$, we conclude that the following hold:

  1. $\pi \rhd \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}_1} s'\, u' : \mathcal{T}$, by applying rule t-app with π_a and π_b as premises, given that $\mathcal{U}^? \lhd \mathcal{U}$ holds

  2. $\zeta \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} \mathbf{v} : \mathcal{S}$, as the result of applying Lemma 19 to ζ_a and ζ_b

3. It is easy to check that the remaining conditions hold.

- t-zero. Analogous to case $\texttt{t-var}_1$.

- t-succ. Then $\pi' \rhd \Phi; \Gamma \vdash^{\mathbf{m}} \mathbf{S}(u) : [\mathbb{S}(\mathcal{N}_i)]_{i \in I}^{\mathsf{nat}}$, where $\mathcal{T} = [\mathbb{S}(\mathcal{N}_i)]_{i \in I}^{\mathsf{nat}}$. Since $t \neq x$, then $t = \mathbf{S}(u')$, with $u = u'\{x := \mathbf{v}\}$. The judgment is derived from $\pi'_0 \rhd \Phi; \Gamma \vdash^{\mathbf{m}} u : \mathcal{N}$, where $\mathcal{N} = +_{i \in I}\mathcal{N}_i$. We can apply IH on π'_0, yielding that there exist family contexts Φ_1, Φ_2, typing contexts Γ_1, Γ_2, multi-counters $\mathfrak{m}_1$, $\mathfrak{m}_2$, an optional multitype $\mathcal{S}^?$ and a multitype $\mathcal{S}$ such that:

  1'. $\pi_0 \rhd \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}_1} u' : \mathcal{N}$, where $\mathcal{N} = +_{i \in I}\mathcal{N}_i$

  2'. $\zeta_0 \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} \mathbf{v} : \mathcal{S}$

  3'. $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m} = \mathfrak{m}_1 + \mathfrak{m}_2$ and $\mathcal{S}^? \lhd \mathcal{S}$

  By taking Φ_1, Φ_2, Γ_1, Γ_2, $\mathfrak{m}_1$, $\mathfrak{m}_2$, $\mathcal{S}^?$ and $\mathcal{S}$ from the IH, we conclude that $\pi \rhd \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}_1} \mathbf{S}(u') : [\mathbb{S}(\mathcal{N}_i)]_{i \in I}^{\mathsf{nat}}$, by applying rule t-succ to π_0. The remaining conditions to met already hold by the IH, letting $\zeta := \zeta_0$.

- t-ifZero. Analogous to case t-app.

- t-ifSucc. Then $\pi' \rhd \Phi_a + \Phi_b; \Gamma_a + \Gamma_b \vdash^{[\texttt{IS}]+\mathfrak{m}_a+\mathfrak{m}_b} \mathsf{if}(s, u, y.\, r) : \mathcal{T}$, where $\Phi = \Phi_a + \Phi_b$ and $\Gamma = \Gamma_a + \Gamma_b$ and $\mathfrak{m} = [\texttt{IS}] + \mathfrak{m}_a + \mathfrak{m}_b$. Then $t = \mathsf{if}(s', u', y.\, r')$, where $s = s'\{x := \mathbf{v}\}$, $u = u'\{x := \mathbf{v}\}$ and $r = r'\{x := \mathbf{v}\}$. The judgment is derived from $\pi'_a \rhd \Phi_a; \Gamma_a \vdash^{\mathfrak{m}_a} s : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}}$ and $\pi'_b \rhd \Phi_b; \Gamma_b, y : \mathcal{N}^? \vdash^{\mathfrak{m}_b} r : \mathcal{T}$, with $\mathcal{N}^? \lhd \mathcal{N}$. We can apply IH on π'_a, yielding that there exist family contexts Φ_{a1}, Φ_{a2}, typing contexts Γ_{a1}, Γ_{a2}, multi-counters $\mathfrak{m}_{a1}$, $\mathfrak{m}_{a2}$, an optional multitype $\mathcal{S}_a^?$ and a multitype $\mathcal{S}_a$ such that:

  a.1. $\pi_a \rhd \Phi_{a1}; \Gamma_{a1}, x : \mathcal{S}_a^? \vdash^{\mathfrak{m}_{a1}} s' : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}}$

  a.2. $\zeta_a \rhd \Phi_{a2}; \Gamma_{a2} \vdash^{\mathfrak{m}_{a2}} \mathbf{v} : \mathcal{S}_a$

  a.3. $\Phi_a = \Phi_{a1} + \Phi_{a2}$ and $\Gamma_a = \Gamma_{a1} + \Gamma_{a2}$ and $\mathfrak{m}_a = \mathfrak{m}_{a1} + \mathfrak{m}_{a2}$ and $\mathcal{S}_a^? \lhd \mathcal{S}_a$

  And we can apply the IH on π'_b, yielding that there exist family contexts Φ_{b1}, Φ_{b2}, typing contexts Γ_{b1}, Γ_{b2}, multi-counters $\mathfrak{m}_{b1}$, $\mathfrak{m}_{b2}$, an optional multitype $\mathcal{S}_b^?$ and a multitype $\mathcal{S}_b$ such that:

  b.1. $\pi_b \rhd \Phi_{b1}; \Gamma_{b1}, y : \mathcal{N}^?, x : \mathcal{S}_b^? \vdash^{\mathfrak{m}_{b1}} r' : \mathcal{T}$

  b.2. $\zeta_b \rhd \Phi_{b2}; \Gamma_{b2} \vdash^{\mathfrak{m}_{b2}} \mathbf{v} : \mathcal{S}_b$

  b.3. $\Phi_b = \Phi_{b1} + \Phi_{b2}$ and $\Gamma_b = \Gamma_{b1} + \Gamma_{b2}$ and $\mathfrak{m}_b = \mathfrak{m}_{b1} + \mathfrak{m}_{b2}$ and $\mathcal{S}_b^? \lhd \mathcal{S}_b$.

  We are allowed to split $\Gamma_b, y : \mathcal{N}^?$ into $(\Gamma_{b1}, y : \mathcal{N}^?)$ and Γ_{b2} by Lemma 5, since by α-conversion we can assume $y \notin \mathsf{fv}(\mathbf{v})$. Taking $\Phi_1 := \Phi_{a1} + \Phi_{b1}$ and $\Phi_2 := \Phi_{a2} + \Phi_{b2}$ and $\Gamma_1 := \Gamma_{a1} + \Gamma_{b1}$ and $\Gamma_2 := \Gamma_{a2} + \Gamma_{b2}$ and $\mathfrak{m}_1 := [\texttt{IS}] + \mathfrak{m}_{a1} + \mathfrak{m}_{b1}$ and $\mathfrak{m}_2 := \mathfrak{m}_{a2} + \mathfrak{m}_{b2}$ and $\mathcal{S}^? := \mathcal{S}_a^? + \mathcal{S}_b^?$ and $\mathcal{S} := \mathcal{S}_a + \mathcal{S}_b$, we conclude that the following hold:

  1. $\pi \rhd \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}_1} \mathsf{if}(s', y, u'.\, r') : \mathcal{T}$, by applying rule t-ifSucc to π_a and π_b, given that $\mathcal{N}^? \lhd \mathcal{N}$ holds

  2. $\zeta \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} \mathbf{v} : \mathcal{S}$, as the result of applying Lemma 19 to ζ_a and ζ_b

  3. $\mathfrak{m} = [\texttt{IS}] + \mathfrak{m}_a + \mathfrak{m}_b = \mathfrak{m}_1 + \mathfrak{m}_2$, and it is easy to check that the remaining conditions hold

- **t-fix.** Then $\pi' \rhd \Phi_0 +_{i \in I} \Phi_i; \Gamma_0 +_{i \in I} \Gamma_i \vdash^{[\mathtt{F}] + \mathfrak{m}_0 +_{i \in I} \mathfrak{m}_i} \mathsf{fix}\, y.\, s : \mathcal{T}$, where $\Phi = \Phi_0 +_{i \in I} \Phi_i$ and $\Gamma = \Gamma_0 +_{i \in I} \Gamma_i$ and $\mathfrak{m} = [\mathtt{F}] + \mathfrak{m}_0 +_{i \in I} \mathfrak{m}_i$. Then $t = \mathsf{fix}\, y.\, s'$, where $s = s'\{x := \mathbf{v}\}$. The judgment is derived from $\pi_0' \rhd \Phi_0, y : \{\!\!\{\mathcal{U}_i\}\!\!\}_{i \in I}; \Gamma_0 \vdash^{\mathfrak{m}_0} s : \mathcal{T}$ and $(\pi_i' \rhd \Phi_i; \Gamma_i \vdash^{\mathfrak{m}_i} \mathsf{fix}\, y.\, s : \mathcal{U}_i)_{i \in I}$. We can then apply the IH on π_0', yielding that then there exist family contexts Φ_{01}, Φ_{02}, typing contexts Γ_{01}, Γ_{02}, multi-counters $\mathfrak{m}_{01}$, $\mathfrak{m}_{02}$, an optional multitype $\mathcal{S}_0^?$ and a multitype $\mathcal{S}_0$ such that:

  1'. $\pi_0 \rhd \Phi_{01}, y : \{\!\!\{\mathcal{U}_i\}\!\!\}_{i \in I}; \Gamma_{01}, x : \mathcal{S}_0^? \vdash^{\mathfrak{m}_{01}} s' : \mathcal{T}$

  2'. $\zeta_0 \rhd \Phi_{02}; \Gamma_{02} \vdash^{\mathfrak{m}_{02}} \mathbf{v} : \mathcal{S}_0$

  3'. $\Phi_0 = \Phi_{01} + \Phi_{02}$ and $\Gamma_0 = \Gamma_{01} + \Gamma_{02}$ and $\mathfrak{m}_0 = \mathfrak{m}_{01} + \mathfrak{m}_{02}$ and $\mathcal{S}_0^? \lhd \mathcal{S}_0$.

  Note that it is not necessary to split $\{\!\!\{\mathcal{U}_i\}\!\!\}_{i \in I}$ since we may assume $y \notin \mathsf{fv}(\mathbf{v})$ by α-conversion, so $y \notin \mathsf{dom}(\Phi_{02})$ by Lemma 5. The conclusions of π_i' for each $i \in I$ are smaller than π', hence we can apply the IH on $(\pi_i')_{i \in I}$, yielding that for each $i \in I$ there exist family contexts $(\Phi_{i1})_{i \in I}$, $(\Phi_{i2})_{i \in I}$, typing contexts $(\Gamma_{i1})_{i \in I}$, $(\Gamma_{i2})_{i \in I}$, multi-counters $(\mathfrak{m}_{i1})_{i \in I}$, $(\mathfrak{m}_{i2})_{i \in I}$, an optional multitype $(\mathcal{S}_i^?)_{i \in I}$ and a multitype $(\mathcal{S}_i)_{i \in I}$ such that:

  i.1. $\pi_i \rhd \Phi_{i1}; \Gamma_{i1}, x : \mathcal{S}_i^? \vdash^{\mathfrak{m}_{i1}} \mathsf{fix}\, y.\, s' : \mathcal{U}_i$

  i.2. $\zeta_i \rhd \Phi_{i2}; \Gamma_{i2} \vdash^{\mathfrak{m}_{i2}} \mathbf{v} : \mathcal{S}_i$

  i.3. $\Phi_i = \Phi_{i1} + \Phi_{i2}$ and $\Gamma_i = \Gamma_{i1} + \Gamma_{i2}$ and $\mathfrak{m}_i = \mathfrak{m}_{i1} + \mathfrak{m}_{i2}$ and $\mathcal{S}_i^? \lhd \mathcal{S}_i$

  Taking $\Phi_1 := \Phi_{01} +_{i \in I} \Phi_{i1}$ and $\Phi_2 := \Phi_{02} +_{i \in I} \Phi_{i2}$ and $\Gamma_1 := \Gamma_{01} +_{i \in I} \Gamma_{i1}$ and $\Gamma_2 := \Gamma_{02} +_{i \in I} \Gamma_{i2}$ and $\mathfrak{m}_1 := [\mathtt{F}] + \mathfrak{m}_{01} +_{i \in I} \mathfrak{m}_{i1}$ and $\mathfrak{m}_2 := \mathfrak{m}_{02} +_{i \in I} \mathfrak{m}_{i2}$ and $\mathcal{S}^? := \mathcal{S}_0^? +_{i \in I} \mathcal{S}_i^?$, and $\mathcal{S} := \mathcal{S}_0 +_{i \in I} \mathcal{S}_i$, we conclude that the following hold:

  1. $\pi \rhd \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}_1} \mathsf{fix}\, y.\, s' : \mathcal{T}$, by applying rule **t-fix** to π_0 and $(\pi_i)_{i \in I}$

  2. $\zeta \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}_2} \mathbf{v} : \mathcal{S}$, as the result of applying Lemma 8 to ζ_0 and $(\zeta_i)_{i \in I}$

  3. It is easy to check that the remainder conditions hold.

$\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\square$

Lemma 13 (Anti-Substitution). *Let* $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}} t\{x := q\} : \mathcal{T}$. *Then there exist a finite set* I, *family contexts* Φ_0, $(\Psi_i)_{i \in I}$, *typing contexts* Γ_0, $(\Delta_i)_{i \in I}$, *multi-counters* $\mathfrak{m}_0$, $(\mathfrak{n}_i)_{i \in I}$ *and multitypes* $(\mathcal{S}_i)_{i \in I}$ *satisfying:*

1. $\pi \rhd \Phi_0, x : \{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I}; \Gamma_0 \vdash^{\mathfrak{m}_0} t : \mathcal{T}$

2. $(\zeta_i \rhd \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} q : \mathcal{S}_i)_{i \in I}$

3. $\Phi = \Phi_0 +_{i \in I} \Psi_i$ *and* $\Gamma = \Gamma_0 +_{i \in I} \Delta_i$ *and* $\mathfrak{m} = \mathfrak{m}_0 +_{i \in I} \mathfrak{n}_i$

Proof. We first consider the case $t = x$, for which we have $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}} q : \mathcal{T}$ as hypothesis. Taking a set I such that its cardinality is 1, and $\Phi_0 := \varnothing$, $\Psi := \Phi$ and $\Gamma_0 := \varnothing$, $\Delta := \Gamma$ and $\mathfrak{m}_0 := [\,]$, $\mathfrak{n} := \mathfrak{m}$ and $\mathcal{S} := \mathcal{T}$, then the following hold:

1. $\pi \rhd x : \{\!\!\{\mathcal{T}\}\!\!\}; \varnothing \vdash^{[\,]} x : \mathcal{T}$, by rule **t-var$_2$**

2. $\zeta_i \rhd \Phi; \Gamma \vdash^{\mathfrak{m}} q : \mathcal{T}$, by hypothesis, since I is a singleton, and we let $\zeta_i := \pi'$

3. $\Phi = \varnothing + \Phi = \Phi_0 + \Psi$ and $\Gamma = \varnothing + \Gamma = \Gamma_0 + \Delta$ and $\mathfrak{m} = [\,] + \mathfrak{m} = \mathfrak{m}_0 + \mathfrak{n}$

If $t \neq x$ then we proceed by induction on π'.

- $\texttt{t-var}_1$. Then $t = y$, with $y \neq x$, and $\pi' \triangleright \varnothing; y : \mathcal{T} \vdash^{[\,]} y : \mathcal{T}$, with $\Phi = \varnothing$ and $\Gamma = y : \mathcal{T}$ and $\mathfrak{m} = [\,]$. Taking $I := \varnothing$ and $\Phi_0 := \Phi$ and $\Gamma_0 := \Gamma$ and $\mathfrak{m}_0 := \mathfrak{m}$, we conclude with $\pi \triangleright \varnothing; y : \mathcal{T} \vdash^{[\,]} y : \mathcal{T}$ by letting $\pi := \pi'$. Item 2 and Item 3 hold trivially since $I = \varnothing$.

- $\texttt{t-var}_2$. Analogous to the previous case.

- $\texttt{t-abs}$. Then $\pi' \triangleright +_{j \in J} \Phi_j; +_{j \in J} \Gamma_j \vdash^{+_{j \in J} \mathfrak{m}_j} \lambda y.\, s : [\mathcal{U}_j^? \to \mathcal{R}_j]^{\mathsf{abs}}_{j \in J}$, with $\Phi = +_{j \in J} \Phi_j$ and $\Gamma = +_{j \in J} \Gamma_j$ and $\mathfrak{m} = +_{j \in J} \mathfrak{m}_j$ and $\mathcal{T} = [\mathcal{U}_j^? \to \mathcal{R}_j]^{\mathsf{abs}}_{j \in J}$. Then $t = \lambda y.\, s'$, with $s = s'\{x := q\}$. The judgment is derived from premises of the form $\pi'_j \triangleright \Phi_j; \Gamma_j, y : \mathcal{U}_j^? \vdash^{\mathfrak{m}_j} s : \mathcal{R}_j$ for each $j \in J$. We can apply the IH on $(\pi'_j)_{j \in J}$, yielding that for each $j \in J$ there exist a finite set I_j, family contexts Φ_{j0} and $(\Psi_k)_{k \in I_j}$, typing contexts Γ_{j0} and $(\Delta_k)_{k \in I_j}$, multi-counters and $\mathfrak{m}_{j0}$ and $(\mathfrak{n}_k)_{k \in I_j}$ and multitypes $(\mathcal{S}_k)_{k \in I_j}$ such that:

  j.1. $\pi_j \triangleright \Phi_{j0}, x : \{\!\{\mathcal{S}_k\}\!\}_{k \in I_j}; \Gamma_{j0}, y : \mathcal{U}_j^? \vdash^{\mathfrak{m}_{j0}} s' : \mathcal{R}_j$

  j.2. $(\zeta_k \triangleright \Psi_k; \Delta_k \vdash^{\mathfrak{n}_k} q : \mathcal{S}_k)_{k \in I_j}$

  j.3. $\Phi_j = \Phi_{j0} +_{k \in I_j} \Psi_k$ and $\Gamma_j, y : \mathcal{U}_j^? = \Gamma_{j0}, y : \mathcal{U}_j^? +_{k \in I_j} \Delta_k$ and $\mathfrak{m}_j = \mathfrak{m}_{j0} +_{k \in I_j} \mathfrak{n}_k$.

  Note that for each $j \in J$ it is not necessary to split $\mathcal{U}_j^?$ since we may assume $y \notin \mathsf{fv}(q)$ by α-conversion, so $y \notin \mathsf{dom}(+_{k \in I_j} \Delta_k)$ by Lemma 5. Taking $I := \uplus_{j \in J} I_j$ and $\Phi_0 := +_{j \in J} \Phi_{j0}$ and $\Psi_i := +_{k \in I_j} \Psi_k$ and $\Gamma_0 := +_{j \in J} \Gamma_{j0}$ and $\Delta_i := +_{k \in I_j} \Delta_k$ and $\mathfrak{m}_0 := +_{j \in J} \mathfrak{m}_{j0}$ and $\mathfrak{n}_i := +_{k \in I_j} \mathfrak{n}_k$ and $\mathcal{S}_i := +_{k \in I_j} \mathcal{S}_k$, we have:

    1. $\pi \triangleright \Phi_0, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I}; \Gamma_0 \vdash^{\mathfrak{m}_0} \lambda y.\, s' : [\mathcal{U}_j^? \to \mathcal{R}_j]^{\mathsf{abs}}_{j \in J}$, by applying rule $\texttt{t-abs}$ to $(\pi_j)_{j \in J}$

    2. $(\zeta_i \triangleright \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} q : \mathcal{S}_i)_{i \in I}$, as the result of applying Lemma 8 to $(\zeta_k)_{k \in I_j}$ for each $j \in J$

    3. $\Phi = +_{j \in J} \Phi_j = +_{j \in J}(\Phi_{j0} +_{k \in I_j} \Psi_k) = \Phi_0 +_{i \in I} \Psi_i$ and $\Gamma = +_{j \in J} \Gamma_j = +_{j \in J}(\Gamma_{j0} +_{k \in I_j} \Delta_k) = \Gamma_0 +_{i \in I} \Delta_i$ and $\mathfrak{m} = +_{j \in J} \mathfrak{m}_j = +_{j \in J}(\mathfrak{m}_{j0} +_{k \in I_j} \mathfrak{n}_k) = \mathfrak{m}_0 +_{i \in I} \mathfrak{n}_i$

- $\texttt{t-app}$. Then $\pi' \triangleright \Phi_a + \Phi_b; \Gamma_a + \Gamma_b \vdash^{[\texttt{B}] + \mathfrak{m}_a + \mathfrak{m}_b} s\, u : \mathcal{T}$, with $\Phi = \Phi_a + \Phi_b$ and $\Gamma = \Gamma_a + \Gamma_b$ and $\mathfrak{m} = [\texttt{B}] + \mathfrak{m}_a + \mathfrak{m}_b$. Then $t = s'\, u'$, with $s\, u = (s'\, u')\{x := q\}$. The judgment is derived from $\pi'_a \triangleright \Phi_a; \Gamma_a \vdash^{\mathfrak{m}_a} s : [\mathcal{U}^? \to \mathcal{T}]^{\mathsf{abs}}$ and $\pi'_b \triangleright \Phi_b; \Gamma_b \vdash^{\mathfrak{m}_b} u : \mathcal{U}$, where $\mathcal{U}^? \lhd \mathcal{U}$. We can apply the IH on π_a, yielding that there exist a finite set I_a, family contexts Φ_{a0} and $(\Psi_i)_{i \in I_a}$, typing contexts Γ_{a0} and $(\Delta_i)_{i \in I_a}$, multi-counters $\mathfrak{m}_{a0}$ and $(\mathfrak{n}_i)_{i \in I_a}$ and multitypes $(\mathcal{S}_i)_{i \in I_a}$ such that:

  a.1. $\pi_a \triangleright \Phi_{a0}, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I_a}; \Gamma_{a0} \vdash^{\mathfrak{m}_{a0}} s' : [\mathcal{U}^? \to \mathcal{T}]^{\mathsf{abs}}$

  a.2. $(\zeta_i \triangleright \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} q : \mathcal{S}_i)_{i \in I_a}$

  a.3. $\Phi_a = \Phi_{a0} +_{i \in I_a} \Psi_i$ and $\Gamma_a = \Gamma_{a0} +_{i \in I_a} \Delta_i$ and $\mathfrak{m}_a = \mathfrak{m}_{a0} +_{i \in I_a} \mathfrak{n}_i$

  And we can apply the IH on π_b, yielding that there exist a finite set I_b, family contexts Φ_{b0} and $(\Psi_i)_{i \in I_b}$, typing contexts Γ_{b0} and $(\Delta_i)_{i \in I_b}$, multi-counters $\mathfrak{m}_{b0}$ and $(\mathfrak{n}_i)_{i \in I_b}$ and multitypes $(\mathcal{S}_i)_{i \in I_b}$ such that:

  b.1. $\pi_b \triangleright \Phi_{b0}, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I_b}; \Gamma_{b0} \vdash^{\mathfrak{m}_{b0}} u' : \mathcal{U}$

  b.2. $(\zeta_i \triangleright \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} q : \mathcal{S}_i)_{i \in I_b}$

  b.3. $\Phi_b = \Phi_{b0} +_{i \in I_b} \Psi_i$ and $\Gamma_b = \Gamma_{b0} +_{i \in I_b} \Delta_i$ and $\mathfrak{m}_b = \mathfrak{m}_{b0} +_{i \in I_b} \mathfrak{n}_i$

  Taking $I := I_a \uplus I_b$ and $\Phi_0 := \Phi_{a0} + \Phi_{b0}$ and $(\Psi_i)_{i \in I} := (\Psi_i)_{i \in I_a \uplus I_b}$ and $\Gamma_0 := \Gamma_{a0} + \Gamma_{b0}$ and $(\Delta_i)_{i \in I} := (\Delta_i)_{i \in I_a \uplus I_b}$ and $\mathfrak{m}_0 := [\texttt{B}] + \mathfrak{m}_{a0} + \mathfrak{m}_{b0}$ and $(\mathfrak{n}_i)_{i \in I} := (\mathfrak{n}_i)_{i \in I_a \uplus I_b}$ and $(\mathcal{S}_i)_{i \in I} := (\mathcal{S}_i)_{i \in I_a \uplus I_b}$, we have:

1. $\pi \triangleright \Phi_{a0} + \Phi_{b0}, x : \{\!\{\mathcal{S}_i\}\!\}_{I_a \uplus I_b}; \Gamma_{a0} + \Gamma_{b0} \vdash^{[\mathtt{B}] + \mathfrak{m}_{a0} + \mathfrak{m}_{b0}} s' \, u' : \mathcal{T}$, by applying rule $\mathtt{t\text{-}app}$ to π_a and π_b, given $\mathcal{U}^? \lhd \mathcal{U}$

2. $(\zeta_i \triangleright \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} q : \mathcal{S}_i)_{i \in I_a \uplus I_b}$ as the result of applying Lemma 8 to $(\zeta_i)_{i \in I_a}$ and $(\zeta_i)_{i \in I_b}$

3. $\Phi = \Phi_a + \Phi_b = \Phi_{a0} + \Phi_{b0} +_{I_a \uplus I_b} \Psi_i = \Phi_0 +_{i \in I} \Psi_i$ and $\Gamma = \Gamma_a + \Gamma_b = \Gamma_{a0} + \Gamma_{b0} +_{I_a \uplus I_b}$ $\Delta_i = \Gamma_0 +_{i \in I} \Delta_i$ and $\mathfrak{m} = [\mathtt{B}] + \mathfrak{m}_a + \mathfrak{m}_b = [\mathtt{B}] + \mathfrak{m}_{a0} + \mathfrak{m}_{b0} +_{I_a \uplus I_b} \mathfrak{n}_i = \mathfrak{m}_0 +_{i \in I} \mathfrak{n}_i$

- $\mathtt{t\text{-}zero}$. Analogous to case $\mathtt{t\text{-}var_1}$.

- $\mathtt{t\text{-}succ}$. Then $\pi' \triangleright \Phi; \Gamma \vdash^{\mathfrak{m}} \mathbf{S}(u) : [\mathbb{S}(\mathcal{N}_j)]^{\mathsf{nat}}_{j \in J}$, where $\mathcal{T} = [\mathbb{S}(\mathcal{N}_j)]^{\mathsf{nat}}_{j \in J}$. Then $t = \mathbf{S}(u')$, with $u = u'\{x := q\}$. The judgment is derived from $\pi'_0 \triangleright \Phi; \Gamma \vdash^{\mathfrak{m}} u : \mathcal{N}$, where $\mathcal{N} = +_{j \in J} \mathcal{N}_j$. We can apply the IH on π'_0, yielding that there exist a finite set I, family contexts Φ_0 and $(\Psi_i)_{i \in I}$, typing contexts Γ_0 and $(\Delta_i)_{i \in I}$, multi-counters $\mathfrak{m}_0$ and $(\mathfrak{n}_i)_{i \in I}$ and multitypes $(\mathcal{S}_i)_{i \in I}$ such that:

  1'. $\pi'_0 \triangleright \Phi_0, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I}; \Gamma_0 \vdash^{\mathfrak{m}_0} u' : \mathcal{N}$, where $\mathcal{N} = +_{j \in J} \mathcal{N}_j$

  2'. $(\zeta_{0i} \triangleright \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} q : \mathcal{S}_i)_{i \in I}$

  3'. $\Phi = \Phi_0 +_{i \in I} \Psi_i$ and $\Gamma = \Gamma_0 +_{i \in I} \Delta_i$ and $\mathfrak{m} = \mathfrak{m}_0 +_{i \in I} \mathfrak{n}_i$

  By taking I and Φ_0 and $(\Psi_i)_{i \in I}$ and Γ_0 and $(\Delta_i)_{i \in I}$ and $\mathfrak{m}_0$ and $(\mathfrak{n}_i)_{i \in I}$ and $(\mathcal{S}_i)_{i \in I}$ from the IH, we obtain $\pi \triangleright \Phi_0, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I}; \Gamma_0 +_{i \in I} \Delta_i \vdash^{\mathfrak{m}_0} \mathbf{S}(u') : [\mathbb{S}(\mathcal{N}_j)]^{\mathsf{nat}}_{j \in J}$ by applying rule $\mathtt{t\text{-}succ}$ with π_0 as premise, and the condition in Item 2 holds by letting $\zeta_i := \zeta_{i0}$ for all $i \in I$. The conditions in Item 3 hold by the IH.

- $\mathtt{t\text{-}ifZero}$. Analogous to case $\mathtt{t\text{-}app}$.

- $\mathtt{t\text{-}ifSucc}$. Then $\pi' \triangleright \Phi_a + \Phi_b; \Gamma_a + \Gamma_b \vdash^{[\mathtt{IS}] + \mathfrak{m}_a + \mathfrak{m}_b} \mathsf{if}(s, u, y.\, r) : \mathcal{T}$, where $\Phi = \Phi_a + \Phi_b$ and $\Gamma = \Gamma_a + \Gamma_b$ and $\mathfrak{m} = [\mathtt{IS}] + \mathfrak{m}_a + \mathfrak{m}_b$. Then $t = \mathsf{if}(s', u', y.\, r')$, with $s = s'\{x := q\}$ and $u = u'\{x := q\}$ and $r = r'\{x := q\}$. The judgment is derived from $\pi'_a \triangleright \Phi_a; \Gamma_a \vdash^{\mathfrak{m}_a} s : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}}$ and $\pi'_b \triangleright \Phi_b; \Gamma_b, y : \mathcal{N}^? \vdash^{\mathfrak{m}_b} r : \mathcal{T}$, where $\mathcal{N}^? \lhd \mathcal{N}$. We can apply the IH on π'_a, yielding that there exist a finite set I_a, family contexts Φ_{a0} and $(\Psi_i)_{i \in I_a}$, typing contexts Γ_{a0} and $(\Delta_i)_{i \in I_a}$, multi-counters $\mathfrak{m}_{a0}$ and $(\mathfrak{n}_i)_{i \in I_a}$ and multitypes $(\mathcal{S}_i)_{i \in I_a}$ such that:

  a.1. $\pi_a \triangleright \Phi_{a0}, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I_a}; \Gamma_{a0} \vdash^{\mathfrak{m}_{a0}} s' : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}}$

  a.2. $(\zeta_i \triangleright \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} q : \mathcal{S}_i)_{i \in I_a}$

  a.3. $\Phi_a = \Phi_{a0} +_{i \in I_a} \Psi_i$ and $\Gamma_a = \Gamma_{a0} +_{i \in I_a} \Delta_i$ and $\mathfrak{m}_a = \mathfrak{m}_{a0} +_{i \in I_a} \mathfrak{n}_i$

  And we can apply the IH on π'_b, yielding that there exist a finite set I_b, family contexts Φ_{b0} and $(\Psi_i)_{i \in I_b}$, typing contexts Γ_{b0} and $(\Delta_i)_{i \in I_b}$, multi-counters $\mathfrak{m}_{b0}$ and $(\mathfrak{n}_i)_{i \in I_b}$ and multitypes $(\mathcal{S}_i)_{i \in I_b}$ such that:

  b.1. $\pi_b \triangleright \Phi_{b0}, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I_b}; \Gamma_{b0}, y : \mathcal{N}^? \vdash^{\mathfrak{m}_{b0}} r' : \mathcal{T}$

  b.2. $(\zeta_i \triangleright \Psi_i; \Delta_i \vdash^{\mathfrak{n}_i} q : \mathcal{S}_i)_{i \in I_b}$

  b.3. $\Phi_b = \Phi_{b0} +_{i \in I_b} \Psi_i$ and $\Gamma_b, y : \mathcal{N}^? = \Gamma_{b0}, y : \mathcal{N}^? +_{i \in I_b} \Delta_i$ and $\mathfrak{m}_b = \mathfrak{m}_{b0} +_{i \in I_b} \mathfrak{n}_i$. Note that it is not necessary to split $\mathcal{N}^?_j$ since we may assume $y \notin \mathsf{fv}(q)$ by α-conversion, so $y \notin \mathsf{dom}(+_{i \in I_b} \Delta_i)$ by Lemma 5.

  Taking $I := I_a \uplus I_b$ and $\Phi_0 := \Phi_{a0} + \Phi_{b0}$ and $(\Psi_i)_{i \in I} := (\Psi_i)_{i \in I_a \uplus I_b}$ and $\Gamma_0 := \Gamma_{a0} + \Gamma_{b0}$ and $(\Delta_i)_{i \in I} := (\Delta_i)_{i \in I_a \uplus I_b}$ and $\mathfrak{m}_0 := [\mathtt{IS}] + \mathfrak{m}_{a0} + \mathfrak{m}_{b0}$ and $(\mathfrak{n}_i)_{i \in I} := (\mathfrak{n}_i)_{i \in I_a \uplus I_b}$ and $(\mathcal{S}_i)_{i \in I} := (\mathcal{S}_i)_{i \in I_a \uplus I_b}$, we have:

1. $\pi \rhd \Phi_{a0} + \Phi_{b0}, x : \{\!\{\mathcal{S}_i\}\!\}_{I_a \uplus I_b} ; \Gamma_{a0} + \Gamma_{b0} \vdash^{[\texttt{IS}] + \mathfrak{m}_{a0} + \mathfrak{m}_{b0}} \text{if}(s', u', y.\, r') : \mathcal{T}$, by applying rule $\texttt{t-ifSucc}$ to π_a and π_b, given $\mathcal{U}^? \lhd \mathcal{U}$

2. $(\zeta_i \rhd \Psi_i ; \Delta_i \vdash^{\mathfrak{n}_i} q : \mathcal{S}_i)_{i \in I_a \uplus I_b}$ as the result of applying Lemma 8 to $(\zeta_i)_{i \in I_a}$ and $(\zeta_i)_{i \in I_b}$

3. $\Phi = \Phi_a + \Phi_b = \Phi_{a0} + \Phi_{b0} +_{I_a \uplus I_b} \Psi_i = \Phi_0 +_{i \in I} \Psi_i$ and $\Gamma = \Gamma_a + \Gamma_b = \Gamma_{a0} + \Gamma_{b0} +_{I_a \uplus I_b}$ $\Delta_i = \Gamma_0 +_{i \in I} \Delta_i$ and $\mathfrak{m} = [\texttt{IS}] + \mathfrak{m}_a + \mathfrak{m}_b = [\texttt{IS}] + \mathfrak{m}_{a0} + \mathfrak{m}_{b0} +_{I_a \uplus I_b} \mathfrak{n}_i = \mathfrak{m}_0 +_{i \in I} \mathfrak{n}_i$

- $\texttt{t-fix}$. Then $\pi' \rhd \Phi' +_{j \in J} \Phi'_j ; \Gamma' +_{j \in J} \Gamma'_j \vdash^{[\texttt{F}] + \mathfrak{m}' +_{j \in J} \mathfrak{m}'_j} \text{fix}\, y.\, s : \mathcal{T}$, where $\Phi = \Phi' +_{j \in J} \Phi'_j$ and $\Gamma = \Gamma' +_{j \in J} \Gamma'_j$ and $\mathfrak{m} = [\texttt{F}] + \mathfrak{m}' +_{j \in J} \mathfrak{m}'_j$. Then $t = \text{fix}\, y.\, s'$, with $s = s'\{x := q\}$. The judgment is derived from $\pi'_0 \rhd \Phi', y : \{\!\{\mathcal{U}_j\}\!\}_{j \in J} ; \Gamma' \vdash^{\mathfrak{m}'} s : \mathcal{T}$ and $(\pi'_j \rhd \Phi'_j ; \Gamma'_j \vdash^{\mathfrak{m}'_j}$ $\text{fix}\, y.\, s : \mathcal{U}_j)_{j \in J}$. We can apply IH on s, yielding that there exist a finite set I', family contexts Φ'_0 and $(\Psi_i)_{i \in I'}$, typing contexts Γ'_0 and $(\Delta_i)_{i \in I'}$, multi-counters $\mathfrak{m}'_0$ and $(\mathfrak{n}_i)_{i \in I'}$ and multitypes $(\mathcal{S}_i)_{i \in I'}$ such that:

1'. $\pi_0 \rhd \Phi'_0, y : \{\!\{\mathcal{U}_j\}\!\}_{j \in J}, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I'} ; \Gamma'_0 \vdash^{\mathfrak{m}'_0} s' : \mathcal{T}$

2'. $(\zeta_i \rhd \Psi'_i ; \Delta'_i \vdash^{\mathfrak{m}'_i} q : \mathcal{S}_i)_{i \in I'}$

3'. $\Phi', y : \{\!\{\mathcal{U}_j\}\!\}_{j \in J} = \Phi'_0, y : \{\!\{\mathcal{U}_j\}\!\}_{j \in J} +_{i \in I'} \Psi_i$ and $\Gamma' = \Gamma'_0 +_{i \in I'} \Delta'_i$ and $\mathfrak{m}' = \mathfrak{m}'_0 +_{i \in I'} \mathfrak{n}'_i$. Note that it is not necessary to split $\{\!\{\mathcal{U}_j\}\!\}_{j \in J}$ since may assume $y \notin \text{fv}(q)$ by α-conversion, so $y \notin \text{dom}(+_{i \in I'} \Psi_i)$ by Lemma 5.

Since the conclusion of π'_j is smaller than (1) for all $j \in J$, we can then apply the IH on $(\pi'_j)_{j \in J}$, yielding that for each $j \in J$, there exist a finite set I'_j, family contexts Φ'_{j0} and $(\Psi'_i)_{i \in I'_j}$, typing contexts Γ'_{j0} and $(\Delta'_i)_{i \in I'_j}$, multi-counters $\mathfrak{m}'_{j0}$ and $(\mathfrak{n}'_i)_{i \in I'_j}$ and multitypes $(\mathcal{S}_i)_{i \in I'_j}$ such that:

j.1. $\pi_j \rhd \Phi'_{j0}, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I'_j} ; \Gamma'_{j0} \vdash^{\mathfrak{m}'_{j0}} \text{fix}\, y.\, s' : \mathcal{U}_j$

j.2. $(\zeta_i \rhd \Psi'_i ; \Delta'_i \vdash^{\mathfrak{m}'_i} q : \mathcal{S}_i)_{i \in I'_j}$

j.3. $\Phi = \Phi_{j0} +_{i \in I_j} \Psi_i$ and $\Gamma = \Gamma_{j0} +_{i \in I_j} \Delta_i$ and $\mathfrak{m} = \mathfrak{m}_{j0} +_{i \in I_j} \mathfrak{n}_i$

Taking $I := I' \uplus_{j \in J} I'_j$ and $\Phi_0 := \Phi'_0 +_{j \in J} \Phi'_{j0}$ and $(\Psi_i)_{i \in I} := (\Psi'_i)_{I' \uplus_{j \in J} I'_j}$ and $\Gamma_0 :=$ $\Gamma'_0 +_{j \in J} \Gamma'_{j0}$ and $(\Delta_i)_{i \in I} := (\Delta'_i)_{I' \uplus_{j \in J} I'_j}$ and $\mathfrak{m}_0 := [\texttt{F}] + \mathfrak{m}'_0 +_{j \in J} \mathfrak{m}'_{j0}$ and $(\mathfrak{n}_i)_{i \in I} :=$ $(\mathfrak{n}'_i)_{I' \uplus_{j \in J} I'_j}$ and and $(\mathcal{S}_i)_{i \in I} := (\mathcal{S}_i)_{I' \uplus_{j \in J} I'_j}$ such that:

1. $\pi \rhd \Phi_0, x : \{\!\{\mathcal{S}_i\}\!\}_{i \in I} ; \Gamma_0 \vdash^{\mathfrak{m}_0} \text{fix}\, y.\, s' : \mathcal{T}$, by applying rule $\texttt{t-fix}$ to π_0 and $(\pi_j)_{j \in J}$

2. $(\zeta_i \rhd \Psi_i ; \Delta_i \vdash^{\mathfrak{n}_i} q : \mathcal{S}_i)_{i \in I}$, as the result of applying Lemma 8 to $(\zeta_i)_{i \in I'}$ and $(\zeta_i)_{i \in I_j}$ for all $j \in J$

3. $\Phi = \Phi' +_{j \in J} \Phi'_j = \Phi'_0 +_{j \in J} \Phi'_{j0} +_{I' \uplus_{j \in J} I'_j} (\Psi'_i)_{I' \uplus_{j \in J} I'_j} = \Phi_0 +_{i \in I} \Psi_i$ and $\Gamma = \Gamma' +_{j \in J}$ $\Gamma'_j = \Gamma'_0 +_{j \in J} \Gamma'_{j0} +_{I' \uplus_{j \in J} I'_j} (\Delta'_i)_{I' \uplus_{j \in J} I'_j} = \Gamma_0 +_{i \in I} \Delta_i$ and $\mathfrak{m}_0 = [\texttt{F}] + \mathfrak{m}' +_{j \in J} \mathfrak{m}'_j =$ $\mathfrak{m}'_0 +_{j \in J} \mathfrak{m}'_{j0} +_{I' \uplus_{j \in J} I'_j} (\mathfrak{n}'_i)_{I' \uplus_{j \in J} I'_j} = \mathfrak{m}_0 +_{i \in I} \mathfrak{n}_i$

$\square$

Lemma 14 (Subject Expansion)**.** *Let $t \to_\rho t'$ and $\pi' \rhd \Phi ; \Gamma \vdash^{\mathfrak{m}'} t' : \mathcal{T}$. Then there exist a derivation π and a multi-counter $\mathfrak{m}$ such that $\mathfrak{m} = [\rho] + \mathfrak{m}'$ and $\Phi ; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$.*

Proof. We proceed by induction on the derivation of $t \to_\rho t'$.

1. **r-beta.** Then $t = (\lambda x.\, s)\,\mathbf{v} \to_{\mathtt{B}} s\{x := \mathbf{v}\} = t'$, with $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}'} s\{x := \mathbf{v}\} : \mathcal{T}$. By Value Anti-Substitution, there exist Φ_1, Φ_2, Γ_1, Γ_2, $\mathfrak{m}'_1$, $\mathfrak{m}'_2$, $\mathcal{S}^?$ and $\mathcal{S}$ such that $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m}' = \mathfrak{m}'_1 + \mathfrak{m}'_2$ and $\mathcal{S}^? \lhd \mathcal{S}$ and $\pi_0 \rhd \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}'_1} s : \mathcal{T}$ and $\zeta \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}'_2} \mathbf{v} : \mathcal{S}$ hold. Hence we build the derivation π as:

$$\dfrac{\dfrac{\pi_0 \rhd \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}'_1} s : \mathcal{T}}{\Phi_1; \Gamma_1 \vdash^{\mathfrak{m}'_1} \lambda x.\, s : [\mathcal{S}^? \to \mathcal{T}]^{\mathsf{abs}}}\,\mathtt{t\text{-}abs} \quad \mathcal{S}^? \lhd \mathcal{S} \quad \zeta \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}'_2} \mathbf{v} : \mathcal{S}}{\Phi; \Gamma \vdash^{[\mathsf{B}]+\mathfrak{m}'} (\lambda x.\, s)\,\mathbf{v} : \mathcal{T}}\,\mathtt{t\text{-}app}$$

2. **r-if0.** Then $t = \mathsf{if}(\mathbf{0}, t', x.\, s) \to_{\mathtt{I0}} t'$ with $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}'} t' : \mathcal{T}$, and we build the derivation π as:

$$\dfrac{\dfrac{}{\varnothing; \varnothing \vdash^{[\,]} \mathbf{0} : [\mathbb{0}]}\,\mathtt{t\text{-}zero} \quad \pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}'} t' : \mathcal{T}}{\Phi; \Gamma \vdash^{[\mathsf{I0}]+\mathfrak{m}'} \mathsf{if}(\mathbf{0}, t', x.\, s) : \mathcal{T}}\,\mathtt{t\text{-}ifZero}$$

3. **r-ifS.** Then $t = \mathsf{if}(\mathbf{S}(\mathbf{k}), s, x.\, u) \to_{\mathtt{IS}} u\{x := \mathbf{k}\} = t'$ with $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}'} u\{x := \mathbf{k}\} : \mathcal{T}$. By Value Anti-Substitution there exist family contexts Φ_1, Φ_2, typing contexts Γ_1, Γ_2, multi-counters $\mathfrak{m}'_1$, $\mathfrak{m}'_2$, an optional multitype $\mathcal{S}^?$, and a multitype $\mathcal{S}$ such that $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m}' = \mathfrak{m}'_1 + \mathfrak{m}'_2$ and $\mathcal{S}^? \lhd \mathcal{S}$ and $\pi_0 \rhd \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}'_1} u : \mathcal{T}$ $\zeta \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}'_2} \mathbf{k} : \mathcal{S}$. Moreover $\mathcal{S}$ is of the form $\mathcal{N}$ by Remark 4. Hence we build π as:

$$\dfrac{\dfrac{\zeta \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}'_2} \mathbf{k} : \mathcal{S}}{\Phi_2; \Gamma_2 \vdash^{\mathfrak{m}'_2} \mathbf{S}(\mathbf{k}) : [\mathbb{S}(\mathcal{S})]}\,\mathtt{t\text{-}succ} \quad \mathcal{S}^? \lhd \mathcal{S} \quad \pi_0 \rhd \Phi_1; \Gamma_1, x : \mathcal{S}^? \vdash^{\mathfrak{m}'_1} u : \mathcal{T}}{\Phi; \Gamma \vdash^{[\mathsf{IS}]+\mathfrak{m}'} \mathsf{if}(\mathbf{S}(\mathbf{k}), s, x.\, u) : \mathcal{T}}\,\mathtt{t\text{-}ifSucc}$$

4. **r-fix.** Then $t = \mathsf{fix}\, x.\, s \to_{\mathtt{F}} s\{x := \mathsf{fix}\, x.\, s\} = t'$ with $\Phi; \Gamma \vdash^{\mathfrak{m}'} s\{x := \mathsf{fix}\, x.\, s\} : \mathcal{T}$. By Anti-Substitution, there exist a finite set I, family contexts Φ_0, $(\Phi_i)_{i \in I}$, typing contexts Γ_0, $(\Gamma_i)_{i \in I}$, multi-counters $\mathfrak{m}'_0$, $(\mathfrak{m}'_i)_{i \in I}$, and multitypes $(\mathcal{S}_i)_{i \in I}$ such that $\Phi = \Phi_0 +_{i \in I} \Phi_i$ and $\Gamma = \Gamma_0 +_{i \in I} \Gamma_i$ and $\mathfrak{m}' = \mathfrak{m}'_0 +_{i \in I} \mathfrak{m}'_i$, and such that $\pi_0 \rhd \Phi_0, x : \{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I}; \Gamma_0 \vdash^{\mathfrak{m}'_0} s : \mathcal{T}$ and $\zeta_i \rhd \Phi_i; \Gamma_i \vdash^{\mathfrak{m}'_i} \mathsf{fix}\, x.\, s : \mathcal{S}_i$ hold for each $i \in I$. Hence we build π as:

$$\dfrac{\pi_0 \rhd \Phi_0, x : \{\!\!\{\mathcal{S}_i\}\!\!\}_{i \in I}; \Gamma_0 \vdash^{\mathfrak{m}'_0} s : \mathcal{T} \quad (\pi_i \rhd \Phi_i; \Gamma_i \vdash^{\mathfrak{m}'_i} \mathsf{fix}\, x.\, s : \mathcal{S}_i)_{i \in I}}{\Phi; \Gamma \vdash^{[\mathsf{F}]+\mathfrak{m}'} \mathsf{fix}\, x.\, s : \mathcal{T}}\,\mathtt{t\text{-}fix}$$

5. **r-appL.** Then $t = s\, u \to_\rho s'\, u = t'$, which is derived from $s \to_\rho s'$. Moreover, we have $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}'} s'\, u : \mathcal{T}$, which can only be derived by rule $\mathtt{t\text{-}app}$, thus π' has the form:

$$\dfrac{\Phi_1; \Gamma_1 \vdash^{\mathfrak{m}'_1} s' : [\mathcal{S}^? \to \mathcal{T}]^{\mathsf{abs}} \quad (1)\ \mathcal{S}^? \lhd \mathcal{S} \quad \pi_2 \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}'_2} u : \mathcal{S}}{\Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{[\mathsf{B}]+\mathfrak{m}'_1+\mathfrak{m}'_2} s'\, u : \mathcal{T}}\,\mathtt{t\text{-}app}$$

where $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m}' = [\mathsf{B}] + \mathfrak{m}'_1 + \mathfrak{m}'_2$. By the IH on $s \to_\rho s'$ there exists $\mathfrak{m}_1$ such that $\mathfrak{m}_1 = [\rho] + \mathfrak{m}'_1$, and $\pi_1 \rhd \Phi_1; \Gamma_1 \vdash^{\mathfrak{m}_1} s : [\mathcal{S}^? \to \mathcal{T}]^{\mathsf{abs}}$. Applying rule $\mathtt{t\text{-}app}$ with π_1, (1) and π_2 as premises, we conclude $\pi \rhd \Phi_1 + \Phi_2; \Gamma_1 + \Gamma_2 \vdash^{[\mathsf{B}]+\mathfrak{m}_1+\mathfrak{m}'_2} s\, u : \mathcal{T}$, where $\mathfrak{m} = [\mathsf{B}] + \mathfrak{m}_1 + \mathfrak{m}'_2$ and verifies $\mathfrak{m} = [\mathsf{B}] + [\rho] + \mathfrak{m}'_1 + \mathfrak{m}'_2 = [\rho] + \mathfrak{m}'$.

6. **r-appR.** Analogous to the previous case.

7. $\texttt{r-succ}$. Then $t = \mathbf{S}(s) \to_\rho \mathbf{S}(s') = t'$, which is derived from $s \to_\rho s'$. Moreover, we have $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}'} \mathbf{S}(s') : \mathcal{T}$, which can only be derived by rule $\texttt{t-succ}$, thus π' has the form:

$$\frac{\Phi; \Gamma \vdash^{\mathfrak{m}'} s' : +_{i \in I} \mathcal{M}_i}{\Phi; \Gamma \vdash^{\mathfrak{m}'} \mathbf{S}(s') : [\mathbb{S}(\mathcal{M}_i)]^{\mathsf{nat}}_{i \in I}} \; \texttt{t-succ}$$

where $\mathcal{T} = [\mathbb{S}(\mathcal{M}_i)]^{\mathsf{nat}}_{i \in I}$. By the IH on $s \to_\rho s'$, there exists $\mathfrak{m}$ such that $\mathfrak{m} = [\rho] + \mathfrak{m}'$, and $\pi_0 \rhd \Phi; \Gamma \vdash^{\mathfrak{m}} s : +_{i \in I} \mathcal{M}_i$. Applying rule $\texttt{t-succ}$ to π_0, we conclude with $\pi \rhd \Phi; \Gamma \vdash^{\mathfrak{m}} \mathbf{S}(s) : [\mathbb{S}(\mathcal{M}_i)]^{\mathsf{nat}}_{i \in I}$, where $\mathfrak{m}$ verifies $\mathfrak{m} = [\rho] + \mathfrak{m}'$ by the IH.

8. $\texttt{r-if}$. Then $t = \mathsf{if}(s, u, x. r) \to_\rho \mathsf{if}(s', u, x. r) = t'$ which is derived from $s \to_\rho s'$. Moreover, we have $\pi' \rhd \Phi; \Gamma \vdash^{\mathfrak{m}'} \mathsf{if}(s', u, x. r) : \mathcal{T}$. We consider two subcases, depending on whether the conclusion of π' is obtained from $\texttt{t-ifZero}$ or $\texttt{t-ifSucc}$:

   8.1 $\texttt{t-ifZero}$. Then there exist family contexts Φ_1, Φ_2, typing contexts Γ_1, Γ_2, and multi-counters $\mathfrak{m}'_1$, $\mathfrak{m}'_2$ such that $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m}' = [\mathtt{I0}] + \mathfrak{m}'_1 + \mathfrak{m}'_2$, and $\pi'_1 \rhd \Phi_1; \Gamma_1 \vdash^{\mathfrak{m}'_1} s' : [\mathbb{0}]$ and $\pi'_2 \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}'_2} u : \mathcal{T}$. By the IH on $s \to_\rho s'$, there exits $\mathfrak{m}_1$ such that $\mathfrak{m}_1 = [\rho] + \mathfrak{m}'_1$, and $\pi_1 \rhd \Phi_1; \Gamma_1 \vdash^{[\rho]+\mathfrak{m}'_1} s : [\mathbb{0}]$. Hence we build π as:

$$\frac{\pi_1 \rhd \Phi_1; \Gamma_1 \vdash^{[\rho]+\mathfrak{m}'_1} s : [\mathbb{0}]^{\mathsf{nat}} \qquad \pi'_2 \rhd \Phi_2; \Gamma_2 \vdash^{\mathfrak{m}'_2} u : \mathcal{T}}{\Phi; \Gamma \vdash^{[\rho]+\mathfrak{m}'} \mathsf{if}(s, u, x. r) : \mathcal{T}} \; \texttt{t-ifZero}$$

   8.2 $\texttt{t-ifSucc}$. Then there exist family contexts Φ_1, Φ_2, typing contexts Γ_1, Γ_2, multi-counters $\mathfrak{m}'_1$, $\mathfrak{m}'_2$, an optional nat-multitype $\mathcal{N}^?$ and a nat-multitype $\mathcal{N}$ such that $\Phi = \Phi_1 + \Phi_2$ and $\Gamma = \Gamma_1 + \Gamma_2$ and $\mathfrak{m}' = [\mathtt{IS}] + \mathfrak{m}'_1 + \mathfrak{m}'_2$ and (1) $\mathcal{N}^? \lhd \mathcal{N}$, and $\pi'_1 \rhd \Phi_1; \Gamma_1 \vdash^{\mathfrak{m}'_1} s' : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}}$ and $\pi'_2 \rhd \Phi_2; \Gamma_2, x : \mathcal{N}^? \vdash^{\mathfrak{m}'_2} r : \mathcal{T}$. By the IH on $s \to_\rho s'$, there exists $\mathfrak{m}_1$ such that $\mathfrak{m}_1 = [\rho] + \mathfrak{m}'_1$, and $\pi_1 \rhd \Phi_1; \Gamma_1 \vdash^{[\rho]+\mathfrak{m}'_1} s : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}}$. Hence we build π as:

$$\frac{\pi_1 \rhd \Phi_1; \Gamma_1 \vdash^{[\rho]+\mathfrak{m}'_1} s : [\mathbb{S}(\mathcal{N})]^{\mathsf{nat}} \qquad (1) \; \mathcal{N}^? \lhd \mathcal{N} \qquad \pi'_2 \rhd \Phi_2; \Gamma_2, x : \mathcal{N}^? \vdash^{\mathfrak{m}'_2} r : \mathcal{T}}{\Phi; \Gamma \vdash^{[\rho]+\mathfrak{m}'} \mathsf{if}(s, u, x. r) : \mathcal{T}} \; \texttt{t-ifSucc}$$

$\square$

Lemma 15 (Normal Forms are Typable). *Let* $t \in \mathsf{NF}_\nu$ *with* ν *a proper nature. Then* $\Phi; \Gamma \vdash^{\mathfrak{m}} t : \mathcal{T}$ *for some* $\mathfrak{m}, \Phi, \Gamma, \mathcal{T}$.

Proof. By induction on the derivation of $t \in \mathsf{NF}_\nu$. Recall cases $\texttt{nf-app}$, $\texttt{nf-succ-stuck}$ and $\texttt{nf-if}$ do not apply since stuck is not a proper nature.

1. $\texttt{nf-abs}$. Then $t = \lambda x. s \in \mathsf{NF}_{\mathsf{abs}}$ and we can type t using $\texttt{t-abs}$.

2. $\texttt{nf-zero}$. Then $t = \mathbf{0} \in \mathsf{NF}_{\mathsf{nat}}$ and we can type t using $\texttt{t-zero}$.

3. $\texttt{nf-succ-nat}$. Then $t = \mathbf{S}(u) \in \mathsf{NF}_{\mathsf{nat}}$ where $u \in \mathsf{NF}_{\mathsf{nat}}$. By IH on $u \in \mathsf{NF}_{\mathsf{nat}}$, $\Phi; \Gamma \vdash^{\mathfrak{m}} u : \mathcal{T}$. Moreover, since u is a normal form with nat nature, it must be the case that $u = \mathbf{k}$, so by Remark 4, $\mathcal{T}$ is of the form $\mathcal{N}$, which can be written as $+_{i \in I} \mathcal{N}_i$. Hence $\Phi; \Gamma \vdash^{\mathfrak{m}} \mathbf{S}(u) : [\mathbb{S}(\mathcal{N}_i)]^{\mathsf{nat}}_{i \in I}$ by applying $\texttt{t-succ}$. $\square$

Theorem 18 (Tight Soundness and Completeness of System $\mathcal{H}$). *Let* t *be a closed term, and* ν *be a proper nature. The following are equivalent:*

1. $\varnothing; \varnothing \vdash^{\mathfrak{m}} t : [\,]^{\nu}$ *with π a tight derivation*

2. *There exists a sequence of steps $t = t_0 \to_{\rho_1} t_1 \ldots \to_{\rho_n} t_n$ where $t_n \in \mathsf{NF}_{\nu}$ and $\mathfrak{m} = [\rho_1, \ldots, \rho_n]$.*

Proof.
$(1 \Rightarrow 2)$ By induction on the size of $\mathfrak{m}$, analyzing whether $t \in \mathsf{NF}_{\nu}$ or not.

- If $t \in \mathsf{NF}_{\nu}$, then t is of the form $\lambda x.\, s$, $\mathbf{0}$, or $\mathbf{S}(\mathbf{k})$, given that ν is a proper nature. Hence t can only be derived by rule t-abs, t-zero, or t-succ respectively. In the three cases we obtain $\mathfrak{m} = [\,]$ by Lemma 6, so taking $n = 0$ we are done.

- If $t \notin \mathsf{NF}_{\nu}$. Then by Proposition 2 it must exist a term t' and a rule name ρ such that $t \to_{\rho} t'$. By Subject Reduction there exists $\mathfrak{m}'$ such that $\mathfrak{m} = [\rho] + \mathfrak{m}'$, and $\varnothing; \varnothing \vdash^{\mathfrak{m}'} t' : [\,]^{\nu}$. By IH on $\mathfrak{m}'$, there exists a sequence of steps $t' \to_{\rho_1} t_1 \ldots \to_{\rho_n} t_n$ where $t_n \in \mathsf{NF}_{\nu}$ and $\mathfrak{m}' = [\rho_1, \ldots, \rho_n]$. By joining this reduction sequence with the reduction step $t \to_{\rho} t'$ we have a reduction sequence, $t \to_{\rho} t' \to_{\rho_1} t_1 \ldots \to_{\rho_n} t_n$, and $\mathfrak{m} = [\rho] + [\rho_1, \ldots, \rho_n]$, so we are done.

$(2 \Rightarrow 1)$ By induction on n.

1. $n = 0$. Then $t \in \mathsf{NF}_{\nu}$, and $\mathfrak{m} = [\,]$. Therefore $\varnothing; \varnothing \vdash^{[\,]} t : [\,]^{\nu}$ holds by Lemma 16.

2. $n > 0$, assuming the property holds for $n - 1$. Taking the reduction sequence of $(n - 1)$ steps from t_1 to t_n, and $\mathfrak{m}' = [\rho_2, \ldots, \rho_n]$ we can apply IH, yielding $\varnothing; \varnothing \vdash^{\mathfrak{m}'} t_1 : [\,]^{\nu}$. Since $t \to_{\rho_1} t_1$, then by Subject Expansion we have $\varnothing; \varnothing \vdash^{\mathfrak{m}} t : [\,]^{\nu}$, with $\mathfrak{m} = [\rho_1] + \mathfrak{m}'$, as stated in the hypothesis, so we are done.

$\square$
